#### ACKNOWLEDGEMENTS

I would like to thank to my PhD advisors, Professors Harry Gray and Jack Richards, for supporting me during these past five years. Harry is someone you will instantly love and never forget once you meet him. He's the funniest advisor and one of the smartest people I know. I hope that I could be as lively, enthusiastic, and energetic as Harry and to someday be able to command an audience as well as he can. Jack has been supportive and has given me the freedom to pursue various projects without objection. He has also provided insightful discussions about the research. I am also very grateful to Jay Winkler for his scientific advice and knowledge and many insightful discussions and suggestions. He is my primary resource for getting my science questions answered and was instrumental in helping me crank out this thesis, all in one month. I also have to thank the members of my PhD committee, Professors Doug Rees, Jackie Barton, and Bil Clemons for their helpful career advice and suggestions in general.

I will forever be thankful to my former college research advisor, Professor Catherine Drennan. Cathy has been helpful in providing advice many times during my graduate school career. She was and remains my best role model for a scientist, mentor, and teacher. I still think fondly of my time as an undergraduate student in her lab. Cathy was the reason why I decided to go to pursue a career in research. Her enthusiasm and love for teaching is contagious.

I also thank my OmpA collaborator, Professor Judy Kim (UCSD), for her help and teaching while she was a postdoc in the Gray group. She's a great spectroscopist and has taught the grad student folders a lot about laser spectroscopy. Judy's a good teacher

iii

who encouraged and expected us to think more independently about our experiments and results.

A good support system is important to surviving and staying sane in grad school. I was lucky to be a part of one we like to call "sub-sub" and refer to Melanie Pribisko, Bert Lai, and myself. These two friends formed the core of my research time in the Gray group. I couldn't have survived Askaban (now called the Red Light District) without them. We've all been there for one another and have taught ourselves and each other many tools and issues of protein folding. I know that I could always ask them for advice and opinions on lab related issues. Mel is a wonderful and generous friend who has been through a lot and I admire her positive outlook and her ability to smile despite the situation. I remember first meeting Mel during our Caltech visiting weekend five years ago and we managed to keep in touch during the year that she was working. I'll never forget the many wonderful lunches and fun activities we've done together, including that huge HBG card. Thanks so much for organizing that post-wedding reception for us! In addition to my husband, Melanie was the one who was there for me during the thesis writing hell to help me quickly proofread and give suggestions. I know that when we are old, Melanie will still be there as a supportive and caring friend. Bert, aka O-B!!!! or just BBB!!! is someone you won't forget. He cares about and will look out for his people. But watch out or else SBW will come out! I know I can count on Bert to always provide helpful suggestions and help with instrumentation and general lab questions. I will miss our silliness and childish sessions like that time we flew first class to San Francisco (my first time in first class! Thanks B!). I still get a laugh when I reminisce about the time sub-sub took a little trip to Rite-aid this past summer.

iv

I thank all the present members of the Gray and Richards group: John Magyar (extremely knowledgeable in just about everything, helpful, and friendly - best of luck at Barnard! Thanks for helping with the prop editing.), Kate Pletneva (has been helpful with answering FET questions and other questions in general, best wishes as you start your career at Dartmouth), Matt Hartings (a nice and helpful person who has been pretty supportive during my search for jobs and writing and will make a good professor soon), Tetsu Kimura (a friendly and knowledgeable expert in protein folding who has also helped me with the laser many times), Keiko Yokoyama (so friendly and I'm glad to have her as a friend) and Lionel Cheruzel (aka Frenchy, the funny and friendly office mate from France). Brian Leigh has been so helpful when I first arrived to Caltech. He was instrumental in helping me through candidacy and I will forever be grateful to him. I'll also not forget his help with moving our refrigerator and use of this good old SUV during the many furniture moves. Best wishes to him as he finishes up.

I also thank the fun 4<sup>th</sup> year students, Bert, Mel, Don (friendly guy from Lousianna and has the most playful cat), Crystal (the group party planner who organizes the Gray group parties), and the optimistic second years, Jillian (friendly, nice, and smart gal, also from MIT), Kyle (throws fun parties and knows how to make delicious drinks), Gretchen (a friendly and all around great labmate who I'm glad to have with us in the Red Light District), Morgan (always friendly and cheerful about everything). They are all a fun bunch with lots of enthusiasm and optimism and remind me of how I used to be when I first got to Caltech. All the young Gray groupers, Heather, Alec, Charlotte, Paul, and Josh for continuing work in the Gray group. I haven't gotten a chance to get to really know them since I've been in a hole this past year but they've all been so friendly and

V

personable to me. I wish these younger students the best of luck and hopefully their time in graduate school won't turn them into bitter old farts like me. I'm also glad to have worked with a wonderful undergraduate student, Ekta Bhojwani for a couple of quarters last year. I value her friendship and support as well.

I also thank people who were not part of the Gray group but helped me out, including Bruce Brunshwig (lots of help with DLS use and background), Yuling Sheng (a wonderful person with great lab skills who was nice to have on the azurin project during my second year), and Cora MacBeth and Professor Jonas Peters during my first year here.

I also thank the past members of the Gray/Richard groups: Malin Abrahamsson (a wonderful and friendly person who was instrumental with helping analyze data for azurin and helped train me on the nanosecond laser system), Jeremy Weaver (great office mate who I would go to for answers to many questions), Jeremiah Miller (helped me a lot when I first got to Caltech and taught me basics of synthesis), Katrine Musich (taught me a lot about azurin purification), Will Wehbi (very knowledgeable about bioinorganic chemistry and a nice person), Angelo Di Bilio (very helpful and knowledgeable about everything related to azurin and I appreciate his help very much), Kristine Jensen (helped me a lot during my first summer and year at Caltech), Yen Nguyen (for many fun and crazy times during my first year), Jasmine Faraone-menella (an extremely nice and helpful person in general), Oliver Wenger (a nice and happy guy who has provided help with using the laser), Karn Sorasaenee (the other Thai person in our group besides me who has been so nice and friendly, good luck at USC!), Steve Contakes (nice guy all around who has helped with nanosecond one measurements during my second year – best wishes at Azusa Pacific!), and Alex Dunn (a smart and nice guy all around who has

vi

provided some good advice when I was searching for postdoc positions). I also thank Kyoko Fujita, Wendy Belliston-bittner, Shantanu Sharma, Libby Mayo, Pierre Kennepohl, Jenn Lee, Randy Villahermosa for also making this an interesting group. Each person listed has played some kind of role in my time here.

I thank Joe Drew, Mo Renteria, and Terry James, the stockroom guys (for all their help these past five years with bringing our needed chemicals and supplies and their help with the stockroom in general), Rick Gerhart (the talented glass blower who has helped fix many of my careless mistakes), and Larry Henling (the small molecule crystallographer who helped with obtaining a structure of a compound I made my first summer). I'll miss Dian Buchness and thank for her hard work. I like to think of her as the guardian angel of the Chemistry department's grad students before she left to start her new position in GPS. I also thank Pat Andersen, Catherine May, and Rick Jackson, Margot Hoyt, and Kathleen Hand for all the administrative help, and Laura Howe for her help these past several months with paperwork for graduation and exams. I also thank the wonderful staff in the Chemistry Department as well as in other departments for always being so helpful and friendly. People here are genuinely nice and want to help you out and I'm glad to have interacted with many. If I have forgotten anyone, I apologize.

I also thank my friends (too many to list here but you know who you are!) for providing support and friendship that I needed. I would like to thank Connie Lu for being supportive throughout my time here and for helping me with proofreading my prop. I think of her as a big sister.

vii

I especially thank my mom, dad, and sister. My hard-working parents have sacrificed their lives for my sister and myself and provided unconditional love and care. I love them so much, and I would not have made it this far without them. My sister has been my best friend all my life and I love her dearly and thank her for all her advice and support. I know I always have my family to count on when times are rough. I thank my beloved dogs, Cotton and Frisky, who have both passed on. I still miss them, especially Cotton, for their friendship while growing up. I wished he could have lived for another few years for my wedding and for my graduation. Special thanks to the newest additions to my family, John, my new husband as well as his wonderful family who all have been supportive and caring.

The best outcome from these past five years is finding my best friend, soul-mate, and husband. I married the best person out there for me. John is the only person who can appreciate my quirkiness and sense of humor. There are no words to convey how much I love him. John has been a true and great supporter and has unconditionally loved me during my good and bad times. He has been non-judgmental of me and instrumental in instilling confidence. He has faith in me and my intellect even when I felt like digging hole and crawling into one because I didn't have faith in myself. These past several years have not been an easy ride, both academically and personally. I truly thank John for sticking by my side, even when I was irritable and depressed. I feel that what we both learned a lot about life and strengthened our commitment and determination to each other and to live life to the fullest.

viii

I dedicate this thesis to my family, my husband, John, and my beloved animals for their constant support and unconditional love. I love you all dearly.

#### ABSTRACT

The field of membrane protein folding is relatively new compared to soluble protein folding. This thesis describes spectroscopy investigations of the refolding and dynamics of a  $\beta$ -barrel membrane protein. The amphiphilic,  $\beta$ -barrel outer membrane protein A (OmpA) refolds and inserts directly into a lipid vesicle or micelle from a denatured state in aqueous urea solution. Spectroscopic probes used to study this system are native tryptophans located at positions 7, 15, 57, 102, and 143. Steady-state and time-resolved fluorescence measurements have been performed using single tryptophan mutants of full-length OmpA (325 residues) and the truncated, transmembrane domain (176 residues). Both full-length and truncated mutants exhibit similar tryptophan emission lifetimes, suggesting that the transmembrane microenvironment is not greatly perturbed by the presence of the C-terminus.

While the microenvironments of folded full-length and truncated OmpA appear similar, the dynamics of refolding at each tryptophan position exhibit subtle differences when the C-terminus is present. Specifically, we observe that tryptophan-102, which faces the pore interior, inserts and folds the fastest while tryptophan-7, which does not cross the bilayer, is the slowest. Fluorescence anisotropy decays also indicate that tryptophan-7 is the most flexible residue compared to the other tryptophans. Temperature studies below the lipid gel-liquid transition temperature have also been performed. In the lipid gel phase, OmpA adsorbs to the surface of the vesicles but contains immediate  $\beta$ sheet structure upon folding as well as very hydrophobic tryptophan environments. It is still uncertain from ensemble measurements whether this species is a true intermediate.

Х

Fluorescence energy transfer kinetics have successfully determined the intramolecular distance between tryptophan-7 and cysteine-175 labeled with a dansyl fluorophore. These results reveal that the barrel ends of OmpA come into contact early in the refolding process and remain close together up to the final assembly of the barrel. We also have evidence that the adsorbed species at low temperatures is not an intermediate in the folding pathway since no energy transfer is observed for this species. These spectroscopic investigations have provided the foundation for further fundamental studies to dissect the molecular mechanism of the folding pathway of OmpA as well as other integral membrane proteins.

## LIST OF FIGURES

Figure 2.1. Schematic of the two-stage model proposed for general	11
folding of $\alpha$ -helical bundles (top) and the concerted model for the folding	
of $\beta$ -barrels into the lipid bilayer.	
Figure 2.2. Schematic illustrating the general cell envelope of <i>E.coli</i> .	14
The inner membrane (IM) is separated from the outer membrane (OM) by	
the aqueous periplasm, which contains the peptidoglycan cell wall	
component. Inner membrane proteins contain $\alpha$ -helical domains while	
outer membrane proteins contain $\beta$ -barrel transmembrane domains. Both	
the IM and OM contain lipoproteins that are attached to their periplasmic	
sides. Adapted from Ruiz et al., 2006.	
Figure 2.3. The amino acid sequence of wt-OmpA is shown. The signal	20
sequence prior to the OmpA sequence is shown in parentheses. Native	
Trp (W7, W15, W57, W102, W143) are highlighted in blue. The last	
residue in all truncated proteins is highlighted in red. A175 is shown in	
green and C290 and C302 that were mutated to serines are shown in	
orange	
Figure 2.4. Structure of the OmpA transmembrane domain (residues 1-	21
171), solved by X-ray crystallography (Pautsch & Schulz, 1998). The 5	
native Trp are shown along with the approximate dimensions and an	
illustration of the C-terminal tail in the periplasmic space. The	
approximate location of the transmembrane region is shown with the red,	
dashed lines.	

Figure 2.5. Schematic of the oriented insertion of OmpA into the lipid	22
vesicles in refolding in vitro experiments. The C-terminus tail of OmpA is	
located on the exterior of the vesicle while the extracellular loops are on	
the interior of the vesicle.	
Figure 2.6. Cross section of the OmpA transmembrane structure	23
displaying the Trp orientations. W102 is the only Trp that faces the	
OmpA pore. The other 4 Trp face the exterior of the bilayer and interact	
with the lipid bilayer.

Figure 5.14. Fluorescence spectra (top) of W7t immediately following156protein injection to initiate folding into DMPC vesicles at 15 °C. Theintensity at 330 nm is shown on the bottom. Spectra are immediatelyblue-shifted upon addition of protein to the cold vesicles. During the 60minutes of data collection, no changes in the spectra and 330 nm valuesare observed.

Figure 5.15. Fluorescence spectra (top) of W15t immediately following157protein injection to initiate folding into DMPC vesicles at 15 °C. Theintensity at 330 nm is shown on the bottom. Spectra are immediatelyblue-shifted upon addition of protein to the cold vesicles. During the 60minutes of data collection, no changes in the spectra and 330 nm valuesare observed.

Figure 5.16. Fluorescence spectra (top) of W102t immediately following158protein injection to initiate folding into DMPC vesicles at 15 °C. Theintensity at 330 nm is shown on the bottom. Spectra are immediatelyblue-shifted upon addition of protein to the cold vesicles. During the 60minutes of data collection, very small changes in the spectra and 330 nmvalues are observed.

**Figure 5.17.** Fluorescence intensity measured at 330 nm for all Trp mutants immediately following protein injection to initiate adsorption onto DMPC vesicles at 15 °C. During the 60 minutes of data collection, no changes in the 330 nm values are observed.

159

**Figure 5.18.** CD spectra of full-length Trp mutants immediately 160 following initiation of a folding reaction in 30 °C DMPC (left) and 15 °C DMPC (right). The time scales for folding are different for 30 °C and 15 °C samples. As the protein refolds, the CD spectra evolved to form  $\beta$ sheet signal for folding at 30 °C. In contrast, no changes in signal were observed for refolding at 15 °C.

**Figure 5.19.** CD spectra of truncated Trp mutants immediately following 161 initiation of a folding reaction in 30 °C DMPC (left) and 15 °C DMPC (right). The time scales for folding are different for 30 °C and 15 °C samples. As the protein refolds, the CD spectra evolved to form  $\beta$ -sheet signal for folding at 30 °C. In contrast, no changes in signal were observed for refolding at 15 °C.

Figure 5.20. Top panel shows the molar ellipticity at 206 nm for full-162length mutants as the proteins fold into DMPC vesicles at 30 °C. Bottompanel shows the molar ellipticity at 206 nm for truncated mutants as theproteins fold into DMPC vesicles at 30 °C.

Figure 5.21. Changes in molar ellipticity at 206 nm for full-length163mutants as the proteins fold into DMPC vesicles at 30 °C. Blue traces are163truncated mutants and red traces are full-length mutants.163

Figure 6.1. Sample potential energy landscape for lysozyme folding.168Adapted from Dobson et al., 1998.

Figure 6.2. Schematic depicting the relationship between protein173conformations and fluorescence decay kinetics. The left side shows asimplified energy landscape funnel. At the top of the funnel, an ensembleof unfolded proteins will exhibit a broad distribution of distances (P(r))between the FET donors and acceptors and slow excited-decay kinetics.At the bottom, an ensemble of folded proteins should exhibit a narrowdistance distribution and faster excited-state decay kinetics. The distancedistance distribution function can be transformed using Eq. 1 to a distribution offluorescence decay rates (k). P(k) can be transformed using Eq. 4 to afluorescence decay intensity profile (I(t)) . Figure obtained from JuliaLyubovitsky's dissertation (Lyubovitsky, 2003).

Figure 6.3. Overlap of NATA emission with normalized Dns absorption.182Figure 6.4. Reaction of a general cysteine with 1,5 IEADANS to produce184the dansylated cysteine on the protein. Note that cysteine was drawn as a<br/>free amino acid for simplicity. In reality, these cysteines are attached to<br/>the protein.

**Figure 6.5.** Structure of OmpA showing the positions and distance of W7 185 and A175C. The  $\alpha$ -carbon position of W7 ~16 Å from to A175C, according to the NMR structure (PDB file IG90).

Figure 6.6. Absorption spectra of time points from a side-by-side labeling 186

reaction of W7/A175C and the control protein, W7/C290S/C302S (abbreviated as W7/0C), with IAEDANS. The ratio of Dns to protein indicates that 5 hr is sufficient for labeling.

Figure 6.7. Fluorescence spectra of full-length W7/A175C-Dns187immediately following protein injection to initiate folding into DMPCvesicles at  $30^{\circ}$ C. Two general processes are observed (top): blue-shift inemission maxima and quantum yield increase. Relative changes inemission maxima (bottom, blue trace) and emission intensity (bottom,green and red traces) are shown as a function of folding time. Traces werenormalized so that a value of "1" corresponds to the emission maximum orintensity at t = 2 hr.hr.

Figure 6.8. Fluorescence spectra of truncated W7t/A175C-Dns188immediately following protein injection to initiate folding into DMPCvesicles at 30 °C. Two general processes are observed (top): blue-shift inemission maxima and quantum yield increase. Relative changes inemission maxima (bottom, blue trace) and emission intensity (bottom,green and red traces) are shown as a function of folding time. Traces werenormalized so that a value of "1" corresponds to the emission maximum orintensity at t = 2 hr.Figure 6.9. Excitation of Dns in W7/A175C-Dns with 340 nm excitation

does not produce a continuous rise in emission.

XXV

following protein injection to initiate folding into DMPC vesicles at  $30^{\circ}$ C. Relative changes in emission maxima (bottom, blue trace) and emission intensity (bottom, red trace) are shown as a function of folding time. Traces were normalized so that a value of "1" corresponds to the emission maximum or intensity at t = 2 hr.

Figure 6.11. Fluorescence spectra of W7t/A175C (unlabeled)191immediately following protein injection to initiate folding into DMPCvesicles at  $30^{\circ}$ C. Relative changes in emission maxima (bottom, bluetrace) and emission intensity (bottom, red trace) are shown as a function offolding time. Traces were normalized so that a value of "1" correspondsto the emission maximum or intensity at t = 2 hr.

Figure 6. 12. Energy transfer rates are shown for the different folding192times for W7/A175C-Dns and W7t/A175C-Dns. The energy transfer rate192has decayed to a constant by ~ 14 min for W7/A175C and between 10-6010-60min for W7t/A175C.10-60

Figure 6. 13. Typical data sets collected for FET kinetics. Top, left graph193are measurements of Trp decays as the protein folds into DMPC vesicles;193Trp decays become only slightly faster as the protein folds. Top, right193graph are measurements of Dns emission using 290 nm excitation; energy193transfer is observed as a slow rise in intensity. Bottom graph is Dns193emission from W7/A175C-Dns in urea; no energy transfer to Dns is193

Figure 6.14. CD spectra of W7/A175C, W7t/A175C, and wild-type 198

OmpA. Note that the ellipticities are lower than those from Chapter 3, most likely due to inaccurate protein concentrations used to determine molar ellipticities.

## LIST OF TABLES

Table 2.1. List of proteins prepared and their number of residues,	37
calculated molecular weight (kDa), and calculated extinction coefficients.	
<b>Table 3.1</b> List of emission maxima for the different Trp mutants in urea,	76
OG micelles, and DMPC vesicles in nm.	
Table 3.2. Exponential (mono-, bi-, tri-) fits of lifetimes of NATA in	78
urea, phosphate buffer, micelles, and vesicles (30 $^{\circ}$ C and 15 $^{\circ}$ C).	
Tryptophan decays were fit with triple exponentials. Amplitudes (amp)	
and their corresponding lifetimes $(\tau)$ are shown as well as the amplitude	
weighted lifetimes.	
Table 3.3. Lifetimes of full-length and truncated mutants unfolded in	80
urea. Tryptophan decays were fit to biexponentials or triple exponentials.	
Amplitudes (amp) and their corresponding lifetimes ( $\tau$ ) are shown as well	
as the amplitude weighted lifetimes.	
Table 3.4. Lifetimes of full-length and truncated mutants folded in OG	82
micelles. Tryptophan decays were fit to triple exponentials. Amplitudes	
(amp) and their corresponding lifetimes ( $\tau$ ) are shown as well as the	
weighted lifetimes.	
<b>Table 3.5.</b> Lifetimes of full-length and truncated mutants folded in	84
DMPC vesicles at 30 °C. Tryptophan decays were fit to biexponentials or	
triple exponentials. Amplitudes (amp) and their corresponding lifetimes	
$(\tau)$ are shown as well as the weighted lifetimes.	

Table 3.6.         Lifetimes of full-length and truncated mutants folded in	87
DMPC vesicles at 15 °C. Tryptophan decays were fitted to	
biexponentials. Amplitudes (amp) and their corresponding lifetimes ( $\tau$ )	
are shown as well as the weighted lifetimes.	
Table 3.7. List summarizing the amplitude weighted lifetimes of NATA	88
and Trp mutants in urea, micelles, and vesicles.	
Table 3.8. Steady-state anisotropy of NATA and Trp mutants in urea, OG	92
micelles, and DMPC vesicles (30°C).	
<b>Table 3.9.</b> Average slow and fast correlation times $(\Theta)$ for both full-	98
length and truncated mutants.	
<b>Table 4.1.</b> Ratios of quenched (F) to unquenched (Fo) emission maxima	121
for 6,7-DiBr and 11,12-DiBr. The quenching rates (ratio of quenched to	
unquenched fluorescence decays) shown are amplitude weighted average	
lifetimes from biexponential fits ( $y = c_0 + ae^{-kt} + be^{-kt}$ ). The unquenched	
fractions (c <sub>o</sub> ) are also listed.	
Table 6.1. Lifetimes and amplitudes of the Dns excited-state decay	183
Table 6.2. W7/A175C folding into DMPC vesicles at 30 °C. Probability	194
weighted energy transfer rates $(k_{et})$ and their corresponding weighted	
distances $(r)$ . The percent of unquenched fluorescence is also listed.	
Table 6.3. Percentage of unquenched Trp fluorescence for W7/A175C	194
folding into DMPC vesicles at 15°C.	
Table 6.4. W7t/A175C folding into DMPC vesicles at 30°C. Probability	195

weighted energy transfer rates  $(k_{et})$  and their corresponding weighted distances (*r*). The percent of unquenched fluorescence is also listed.

Table 6.5.         Percentage of unquenched Trp fluorescence for W7t/A175C	195
folding into DMPC vesicles at 15°C.	

Table 6.6. W7/A175C folding into OG micelles at 30°C. Probability	196
weighted energy transfer rates $(k_{et})$ and their corresponding weighted	
distances $(r)$ . The percent of unquenched fluorescence is also listed.	
Table 6.7. W7/A175C folding into OG micelles at 15°C. Probability	196
weighted energy transfer rates $(k_{et})$ and their corresponding weighted	
distances $(r)$ . The percent of unquenched fluorescence is also listed.	
<b>Table 6.8</b> W7t/A 175C folding into OG micelles at $30^{\circ}$ C. Probability	107

**Table 6.8.** W7t/A175C folding into OG micelles at 30°C. Probability197weighted energy transfer rates  $(k_{et})$  and their corresponding weighteddistances (r). The percent of unquenched fluorescence is also listed.

**Table 6.9.** W7t/A175C folding into OG micelles at  $15^{\circ}$ C. Probability197weighted energy transfer rates ( $k_{et}$ ) and their corresponding weighteddistances (r). The percent of unquenched fluorescence is also listed.
