## CHAPTER 2

## Formal (3 + 2) Cycloaddition Approach to Pyrroloindolines ${ }^{\text {t }}$

### 2.1 INTRODUCTION

As discussed in Chapter 1, many approaches have recently been reported for the direct, enantioselective, catalytic construction of pyrrolindolines from indole precursors. However, when we initially began our efforts in this field only two reports of this type had been disclosed, the iminium catalysis and allylic alkylation approaches from the groups of MacMillan and Trost. This chapter describes the development of a new approach to pyrroloindolines involving an $(R)$ - $\mathrm{BINOL} \cdot \mathrm{SnCl}_{4}$-catalyzed formal $(3+2)$ cycloaddition of 3 -substituted indoles and 2-amidoacrylates. This reaction is tolerant to diverse substitution patterns and is the only direct, enantioselective approach that incorporates the necessary C2-stereocenter for advancement to diketopiperazine natural products. Mechanistic studies will be discussed that confirmed an asymmetric protonation as the enantiodetermining step and ultimately led to the development of a

[^0]tandem conjugate addition/enantioselective protonation reaction for the synthesis of tryptophan derivatives (Chapter 3).

### 2.1.1 Design of the Cycloaddition Approach

The majority of catalytic, asymmetric indole functionalization approaches to prepare pyrroloindolines, including the seminal reports of MacMillan ${ }^{1}$ and Trost, ${ }^{2}$ involve the electrophilic substitution of tryptamine substrates. In our effort to provide a complementary approach to pyrroloindolines, we became interested in the possibility of a formal $(3+2)$ cycloaddition reaction between 3 -substituted indoles (90) and 2amidoacrylates (91) that constitutes a formal $(3+2)$ cycloaddition (Scheme 2.1.1). Successful realization of the proposed transformation could allow rapid access to a variety of substitution patterns and the pyrroloindoline-2-carboxylate products (92) formed should be suitable precursors for elaboration to diketopiperazine natural products (e.g. chaetocin (3, Figure 1.1.1)).

Scheme 2.1.1. Our proposed reaction and precedent in tryptophan synthesis.

Proposed Formal $(3+2)$ Cycloaddition Reaction:

Synthesis of Tryptophan Derivatives by Piersanti and coworkers, 2008:

Although the potential for reaction between 3-substituted indoles and weak electrophiles such as amidoacrylates was unclear at the outset of this project, we were
particularly encouraged by the recent findings of Piersanti and coworkers reported in 2008. ${ }^{3}$ These authors disclosed that Lewis acids promote the condensation of C3unsubstituted indoles $\left(\mathbf{9 0}, \mathrm{R}^{1}: \mathrm{H}\right)$ and methyl 2-acetamidoacrylate (91a) to afford FriedelCrafts alkylation products as racemates (Scheme 2.1.1). Interestingly, the regioselectivity of addition to 91a strongy depends on the choice of Lewis acid; whereas hard, oxaphilic Lewis acids such as $\mathrm{EtAlCl}_{2}$ afford tryptophan derivatives (94), softer, more azaphilic Lewis acids such as $\mathrm{Bi}(\mathrm{OTf})_{3}$ result in reaction of the acrylate via the imine tautomer to generate quaternary amides (93).

Scheme 2.1.2. Proposed mechanisms of $\mathbf{9 2}$ and $\mathbf{9 4}$ formation.

Mechanistically, Piersanti's reaction to prepare tryptophan $\mathbf{9 4}$ is proposed to occur by conjugate addition at C 3 of the indole to generate transient enolate 96 , followed by rearomatization and protonation (Scheme 2.1.2). We envisioned that in the case of 3substituted indoles, the initial conjugate addition would still occur; however, instead of rearomatization, enolate protonation and cyclization of the pendant amide nitrogen to the transiently generated iminium ion $\mathbf{9 8}$ could provide the desired pyrroloindoline product (92) in a single operation. The mechanism for the Friedel-Crafts alkylation has not been
thoroughly investigated, but notably this reaction requires two equivalents of Lewis acid.
By ${ }^{1} \mathrm{H}$ NMR, Piersanti and coworkers found that subjection of methyl 2acetamidoacrylate 91a to 1 equivalent of $\mathrm{EtAlCl}_{2}$ resulted in broadening of signals from a vinyl proton and the amide proton and methyl substituents, whereas subjection to two equivalents resulted in complete broadening of the acrylate signals. These experiments suggest that the reaction is second-order in the Lewis acid and proceeds via doubly activated enolate 95 .

The requirement of superstoichiometric Lewis acid in the Friedel-Crafts reaction suggested that the development of the formal $(3+2)$ cycloaddition reaction using a catalytic Lewis acid would be challenging; however, we were encouraged by the general reactivity of amidoacrylates observed in the tryptophan synthesis as well as the potential for straightforward screening given the commercial availability of all reagents.

### 2.2 DEVELOPMENT OF THE FORMAL CYCLOADDITION REACTION ${ }^{4}$

### 2.2.1 Identification of an Effective Lewis Acid

Our studies began with the reaction between 3-methylindole (99) and methyl 2acetamidoacrylate (91a). A screen of Lewis acids revealed that use of two equivalents $E t \mathrm{AlCl}_{2}$ delivered the desired pyrroloindoline (100a) as the major product in 3:1 dr favoring the exo diastereomer, although the C2 Friedel-Crafts alkylation product (101) was also observed (Table 2.2.1, entry 2). Consistent with Piersanti and coworkers' findings in the synthesis of tryptophan derivatives, no reaction occurred in the presence of stoichiometric $\mathrm{EtAlCl}_{2}$ (entry 1); however, 1.0 equivalent of $\mathrm{SnCl}_{4}$ was found to promote the reaction with comparable 6:1 selectivity for pyrroloindoline formation over
alkylation (entry 3). Fortunately, methylation of the indole nitrogen increased the regioselectivity for the pyrroloindoline product (entry 8). Attempted reactions with catalytic loadings identified that this reaction requires stoichiometric quantities of $\mathrm{SnCl}_{4}$. Interestingly, the yield of pyrroloindoline is dramatically reduced using substoichiometric quantities of $\mathrm{SnCl}_{4}$, with no product formed when $50 \mathrm{~mol} \%$ is employed (entry 9 ).

Under our initially optimized conditions for this transformation, exposure of 1,3dimethylindole (75) and methyl 2-acetamidoacrylate (91a) to 1.2 equivalents $\mathrm{SnCl}_{4}$ in dichloroethane gave the desired pyrroloindoline 100b in $64 \%$ yield as a $6: 1$ mixture of exo and endo diastereomers (entry 10).

### 2.2.2 Identification of Enantioselective Conditions and Optimization

In light of our preliminary results with $\mathrm{SnCl}_{4}$, we initiated studies targeting an asymmetric variant of the formal $(3+2)$ cycloaddition reaction. A screen of a variety of
chiral ligands previously reported to be used in conjunction with $\mathrm{SnCl}_{4}$ revealed that use of $(R)$-BINOL provides $\mathbf{1 0 0 b}$ in promising enantioselectivity. Thus, treatment of 1,3dimethylindole (75) and methyl 2-acetamidoacrylate (91a) with a 1.1:1 mixture of $(R)$ BINOL and $\mathrm{SnCl}_{4}$ provided pyrroloindoline $\mathbf{1 0 0 b}$ in $86 \%$ yield as a $4: 1$ mixture of diastereomers, with the exo diastereomer formed in $64 \%$ ee (Table 2.2.2, entry 2).

Table 2.2.2. (R)-BINOL loading optimization studies.

${ }^{a}$ Isolated yield of combined diastereomers. ${ }^{b}$ Determined by ${ }^{1} \mathrm{H}$ NMR analysis of crude reaction mixture. ${ }^{c}$ Determined by chiral stationary phase SFC. ${ }^{d}$ ee of exolendo diastereomers. ${ }^{e}$ Reaction run for $30 \mathrm{~h} .{ }^{f}$ Reaction run for $3.5 \mathrm{~h} .{ }^{g} 1.0$ equiv of $\mathrm{SnCl}_{4}$ was used. ${ }^{h}$ Reaction run for 3 h .

Somewhat surprisingly, side-by-side reactions of 1,3-dimethylindole (75) and methyl 2-acetamidoacrylate (91a) combined in the presence and absence of stoichiometric BINOL, under otherwise identical conditions, revealed that BINOL accelerates the rate of the reaction and provides $\mathbf{1 0 0 b}$ in improved yield. ${ }^{5}$ Based on these observations, it was hypothesized that similar enantioselectivities might be accessible using only catalytic quantities of ( $R$ )-BINOL. Gratifyingly, treatment of 1,3-dimethylindole (75) and methyl 2-acetamidoacrylate (91a) with 1.2 equivalents $\mathrm{SnCl}_{4}$ and $20 \mathrm{~mol} \%(R)$-BINOL furnished the desired pyrroloindoline $\mathbf{1 0 0 b}$ in $94 \%$ yield as a 5:1 mixture of diastereomers, favoring the exo diastereomer in $63 \%$ ee (Table 2.2.2, entry 4).

Remarkably, moderate levels of enantioselectivity are observed even when the reaction is conducted with $5 \mathrm{~mol} \%(R)$-BINOL (entry 6 ).

In our initial effort to improve the enantioselectivity, we first evaluated the effect of temperature. Unlike many transformations that proceed optimally at lower temperature, reduced ee and dr are observed for the formal $(3+2)$ cycloaddition under these conditions (Table 2.2.3, entries 3-4). Alternatively, conducting the reaction above room temperature did not significantly alter the selectivity (entry 5). Notably, similar temperature effects have been reported in a few instances involving Lewis acid•BINOL complexes. ${ }^{6}$

More promising effects were found by varying acrylate substitution. Utilization of methyl 2-trifluoroacetamidoacrylate (91b) and benzyl 2-acetamidoacrylate (91c) provided pyrroloindoline products $100 \mathbf{c}$ and $\mathbf{1 0 0 d}$ in enhanced enantioselectivities, with
the exo diastereomers formed in $86 \%$ and $74 \%$ ee, respectively (Table 2.2.3, entries 6-7).
Fortunately, these effects were additive; reaction of benzyl 2-trifluoroacetamidoacrylate (91d) afforded pyrroloindoline 100e in $81 \%$ yield as a $3: 1$ mixture of exo and endo diastereomers produced in $91 \%$ and $90 \%$ ee, respectively (entry 8 ). A solvent screen revealed that chlorinated solvents are optimal and switching from DCE to DCM afforded 100e in $86 \%$ yield and $94 \%$ ee for the exo diastereomer (entry 9).

With these optimized reaction conditions in hand, we reevaluated the parameters of the formal $(3+2)$ cycloaddition reaction and confirmed that a Lewis acid is required for the transformation; exposure of 1,3-dimethylindole (75) and 91d to Brønsted acids, including ( $R$ )-BINOL, HCl , and $\mathrm{Ph}_{2} \mathrm{PO}_{2} \mathrm{H}$ (Table 2.2.4, entries 1-3) gave no reaction. Several water and acid scavenging additives were also screened but no significant change in enantioselectivity was observed in their presence (entries 4, 5 and 7).

Although ( $R$ )-BINOL ultimately proved to afford the highest enantioselectivities, various BINOL derivatives as well as other chiral diols were also evaluated in the course
of efforts to determine optimal conditions and to investigate the mechanism of this transformation. (R)-2'-methoxy-[1,1'-binaphthalen]-2-ol (102b) promoted 100b formation in a reduced $40 \%$ ee, suggestive of an important role for the hydroxyl protons in the enantiodetermining step (Table 2.2.5, entry 2). Furthermore, sterically hindered BINOL derivatives $102 \mathrm{c}-\mathbf{e}$ provided $\mathbf{1 0 0 b}$ as a racemate, but with good diastereoselectivity (entries 3-5). 6,6'-dibromo-BINOL (102f), which is sterically similar to BINOL but more electron deficient, afforded pyrroloindoline $\mathbf{1 0 0 c}$ in slightly reduced ee (entry 7) and non-BINOL-derived chiral diols, TADDOL (103) and hydrobenzoin (104), gave 100c in 0 and $46 \%$ ee, respectively (entries 8 and 9).

### 2.2.3 Substrate Scope of Pyrroloindoline Synthesis

Scheme 2.2.1. Substrate scope.

${ }^{a}$ Determined by ${ }^{1} \mathrm{H}$ NMR analysis of mixture. ${ }^{b}$ Determined by chiral SFC or HPLC analysis. ${ }^{c} 1.6$ equiv $\mathrm{SnCl}_{4}$ was employed.

The enantioselective formal $(3+2)$ cycloaddition with benzyl 2 trifluoroacetamidoacrylate (91d) is general for a range of indole substrates. Indoles substituted at C5 with either electron-donating or electron-withdrawing groups are tolerated in this reaction, although electron-poor indoles react at a slower rate (Scheme 2.2.1, 106a-e). Indoles substituted at C3 with functionalized alkyl groups reacted in moderate to good yields with high enantioselectivity (106f and 106h). Notably, the reaction of $N$-methyltetrahydrocarbazole proceeded with $>18: 1$ diastereoselectivity, delivering the exo diastereomer $\mathbf{1 0 6 g}$ in $86 \%$ ee. In a single step, this reaction generates the aza-propellane core of the natural products minfiensine, ${ }^{7}$ echitamine, ${ }^{8}$ and vincorine. ${ }^{9}$ Consistent with our preliminary findings, $N$-alkylation is important to the reactivity;
subjection of 3-methylindole to identical conditions provided pyrroloindoline $\mathbf{1 0 6 j}$ in only $18 \%$ yield albeit with excellent enantioselectivity. However, $N$-allyl-3-methylindole (105i) was successfully employed as a substrate to afford pyrroloindoline 106i. The combination of $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ and $\mathrm{N}, \mathrm{N}$-dimethylbarbituric acid have been shown to smoothly convert related methyl ester $\mathbf{1 0 7}$ to the deallylated product $\mathbf{1 0 8}$ (Scheme 2.2.2); ${ }^{10}$ this finding is particularly useful in the context of total synthesis as many pyrroloindoline natural products do not bear substitution on nitrogen.

Scheme 2.2.2. Pd-catalyzed deallylation of pyrroloindoline methyl ester 107.

Although many substrates are well-tolerated in the formal $(3+2)$ cycloadditon reaction, this transformation proved challenging for more sterically encumbered substrates. 3a-Indolylpyrroloindolines constitute a large number of pyrroloindoline natural products and thus, we were also very interested in accessing arylpyrroloindolines using the formal $(3+2)$ cycloaddition methodology. However, subjection of 1-methyl-3phenylindole (109) to our standard conditions with methyl 2-trifluoroacetamidoacrylate (91b) resulted in no reaction whereas exposure to methyl 2-acetamidoacrylate (91a) gave low conversion to the corresponding C2-alkylation product (Scheme 2.2.3). Clean conversion to C2-alkylation product $\mathbf{1 1 2}$ has also been observed for 3-phenylindole (111) in the presence of $\mathrm{EtAlCl}_{2}$.

Alternatively, we also envisioned a two-step approach to generate indolylpyrroloindolines through initial formation of 3a-alkynylpyrroloindolines and a
subsequent Larock annulation; however, subjection of 1-methyl-3-ethynylindole (113) and 91a to $\mathrm{SnCl}_{4}$ gave decomposition and subjection of 1-methyl-3(phenylethynyl)indole (115) and 91a to $\mathrm{SnCl}_{4}$ resulted in dimerization of the indole, even when 115 was added slowly to the reaction mixture over 2 hours.

In a final effort to access arylpyrroloindolines, we employed 1,3-dimethyl-3phenylindole (117) as the substrate to ensure complete selectivity for pyrroloindoline formation by prohibiting Friedel-Crafts alkylation. Although exposure of 117 and 91a to standard conditions gave only trace conversion to phenylpyrroloindoline $\mathbf{1 1 8}$ (Table 2.2.6, entry 1), addition of 0.20 equiv MeOH cleanly afforded 118 in $40 \%$ yield as a single diastereomer in $91 \%$ ee (entry 4). Unfortunately, prolonged reaction times and
increased $\mathrm{SnCl}_{4}$ loading did not substantially improve yield (entries 5 and 7) and inconsistent ees varying from $84-91 \%$ were obtained for the reaction (entries 4-6).

Scheme 2.2.4. Subjection of 2-trimethylsilylindole $\mathbf{1 1 9}$ to cycloaddition conditions. ${ }^{*}$

When we first discovered this transformation, no other direct enantioselective approaches to arylpyrroloindolines had been reported. Most natural products are unsubstituted at C 2 a and thus, we elected to pursue this transformation using 2(trimethylsilyl)indole 119, which could undergo desilylation in a second step following cycloaddition to generate C2-unsubstituted pyrroloindolines; however, we found that protodesilylation occurs readily in the presence of $\mathrm{SnCl}_{4}$ to give 1-methyl-2-phenylindole
(109, Scheme 2.2.4). ${ }^{\hbar}$ At this point, no further work is being conducted to extend this pyrroloindoline methodology to sterically encumbered substrates. However, these challenges ultimately provided inspiration for the development of a second approach to pyrroloindolines within our laboratory involving the Cu -catalyzed arylation of tryptamine ${ }^{11}$ and tryptophan derivatives ${ }^{12}$ using aryl iodonium salts.

### 2.3 MECHANISTIC CONSIDERATIONS

Scheme 2.3.1. Epimerization studies.

The formal $(3+2)$ cycloaddition reaction favors formation of the exo pyrroloindoline product. Previous studies regarding pyrroloindolines have revealed that the exo diastereomer is the kinetic product and the endo diastereomer is thermodynamically favored. ${ }^{13}$ With the objective of accessing the endo diastereomer, we carried out epimerization studies on the product mixture resulting from the formal $(3+2)$ cycloaddition of 1,3-dimethylindole (75) and benzyl 2-trifluoroacetamidoacrylate (91d)

[^1](Scheme 2.3.1). In the presence of excess DBU, the $4: 1$ mixture of exo and endo diastereomers ( $94 \%$ and $91 \%$ ee) was cleanly converted to the endo diastereomer. Surprisingly, the endo diastereomer was recovered in $56 \%$ ee, favoring the opposite enantiomer. These results indicate that the diastereomers formed in the formal $(3+2)$ cycloaddition reaction are of opposite enantiomeric series. Calculations given this assumption predict an enantioselectivity of $58 \%$ ee. This result was confirmed by control experiments involving exposure of the pure exo diastereomer to DBU; exposure of $94 \%$ ee exo-100e to the epimerization conditions returned ent-endo-100e in $94 \%$ ee.

Scheme 2.3.2. Proposed mechanism for stereoselective cycloaddition reaction.

iminium ion observed by NMR

Current efforts are focused on understanding the mechanism of $\mathrm{BINOL} \cdot \mathrm{SnCl}_{4}$ catalyzed pyrroloindoline formation. However, one possible scenario consistent with the experimental data is shown in Scheme 2.3.2. In this mechanism, it is proposed that $\mathrm{SnCl}_{4}{ }^{-}$ promoted conjugate addition of the indole to the acrylate proceeds reversibly to afford a
racemic mixture of enolates $\mathbf{1 2 1}$ and ent-121. In the second step, an irreversible, highly face-selective, catalyst controlled protonation would serve to resolve the two enantiomers into diastereomeric iminium ions exo-122 and endo-122. In this mechanistic hypothesis, the diastereoselectivity depends on the relative rates of protonation of $\mathbf{1 2 1}$ and ent-121. Subsequent catalyst turnover by deprotonation of the amide followed by cyclization upon workup would deliver exo-100e and endo-100e.

It is proposed that $\mathrm{SnCl}_{4} \bullet \mathrm{BINOL}$ complex $\mathbf{1 2 5}$ serves as a chiral proton source to set the absolute stereochemistry of exo-100e and endo-100e by protonation of enolates $\mathbf{1 2 1}$ and ent-121. Enantioselective protonations promoted by $(R)$ - $\mathrm{BINOL} \cdot \mathrm{SnCl}_{4}$ complexes are well documented based on extensive studies by Yamamoto and coworkers. In these reports, it is suggested that $(R)$ - $\mathrm{BINOL} \cdot \mathrm{SnCl}_{4}$ serves as a chiral Lewis acid-assisted Brønsted acid (LBA) to effect protonation. ${ }^{14}$ In the Yamamoto examples, use of a less reactive stoichiometric achiral phenol is required to turnover the catalyst. ${ }^{14 b}$ In the formation of pyrroloindolines $\mathbf{1 0 0 e}$, the active catalyst $\mathbf{1 2 5}$ might be regenerated from 126 by protonation with the amide proton of exo-123 and endo-123, thereby affording 124. These protonated iminium species are stable under the reaction conditions as identified by ${ }^{1} \mathrm{H}$ NMR and undergo cyclization to afford exo-100e and endo-100e during the work-up. Notably, resubjection of exo-100e to the reaction conditions cleanly regenerates iminium $\mathbf{1 2 4}$ without any erosion of ee, thus confirming the irreversibility of the protonation step.

### 2.4 CONCLUDING REMARKS

In summary, we have established a unique strategy for the direct prepararation of enantioenriched pyrroloindolines by an $(R)$ - $\mathrm{BINOL} \cdot \mathrm{SnCl}_{4}$-catalyzed formal $(3+2)$
cycloaddition reaction. The transformation requires an equivalent of $\mathrm{SnCl}_{4}$ but addition of $(R)$-BINOL creates such a large rate acceleration that the reaction can be completed with catalytic loadings of BINOL in excellent enantioselectivity. The method allows access to a variety of pyrroloindolines including new structural motifs such as azapropellanes $(\mathbf{1 0 6 g})$. Although the reaction proceeds poorly with more sterically encumbered substrates, we have found that additional of catalytic MeOH greatly improves reactivity and enables access to phenylpyrroloindoline product $\mathbf{1 1 8}$.

The formal $(3+2)$ cycloaddition reaction has been exploited both in the development of new methodology and in total synthesis. Mechanistic studies of this reaction showed that the reaction occurs via a highly face-selective catalyst-controlled protonation and that cyclization of the resultant iminium intermediate only occurs upon work-up; these observations have respectively led to the development of a tandem conjugate addition/enantioselective protonation reaction (Chapter 3) and to the generation of indoline products by in situ iminium reduction. ${ }^{8,15}$ In addition, synthetic efforts using this reaction have culminated in the efficient total syntheses of two diketopiperazinecontaining pyrroloindoline natural products lansai $B^{16}$ and nocardioazine A. ${ }^{17, * *}$ Further related research within the Reisman laboratory is focused on improving mechanistic understanding of the formal $(3+2)$ cycloaddition reaction, application of the asymmetric protonation strategy to new methodology, and the synthesis of pyrroloindoline alkaloid natural products.

### 2.5 EXPERIMENTAL SECTION

### 2.5.1 Materials and Methods

Unless otherwise stated, reactions were performed under a nitrogen atmosphere using freshly dried solvents. Tetrahydrofuran, methylene chloride, toluene, and hexanes were dried by passing through activated alumina columns. Dimethylformamide was dried over activated molecular sieves, dichloroethane was distilled over calcium hydride. Deuterated methylene chloride $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right)$ for the experiments resubjecting the pyrroloindoline products to reaction conditions was dried by passing through a plug of activated alumina. All other commercially obtained reagents were used as received unless specifically indicated. $\mathrm{EtAlCl}_{2}$ (neat) and $1 \mathrm{M} \mathrm{SnCl}_{4}$ in DCM were purchased from Aldrich and $(R)$ BINOL was obtained from Alfa Aesar. ( $R$ )-6,6'-dibromo-BINOL (102f), ${ }^{18}(R)$-2'-methoxy-[1,1'-binaphthalen]-2-ol (102b) ${ }^{19}$, TADDOL (103), ${ }^{20}$ 3-phenylindole (111), ${ }^{21}$ and 1-methyl-3-phenylindole (109) $)^{22}$ were prepared according to literature procedures. 1-methyl-3-(phenylethynyl)indole (115), ${ }^{23}(R)-3,3$ '-dianthryl-BINOL (102e), ${ }^{24}(R)-3,3^{\prime}$ -dimesityl-BINOL $(\mathbf{1 0 2 c})^{25}$ and $(R)-3,3$ '-di(triphenylsilyl)-BINOL $(\mathbf{1 0 2 d})^{26}$ are known and were prepared by procedures adapted from the literature. Reactions were monitored by thin-layer chromatography using EMD/Merck silica gel 60 F254 pre-coated plates (0.25 mm ) and were visualized by UV, $p$-anisaldehyde, or $\mathrm{KMnO}_{4}$ staining. Flash column chromatography was performed either as described by Still et al. ${ }^{27}$ using silica gel (particle size 0.032-0.063) purchased from Silicycle or pre-packaged RediSep ${ }^{\circledR} \mathrm{Rf}$ columns on a CombiFlash Rf system (Teledyne ISCO Inc.). Diastereomeric ratios were determined by integration of NMR spectra or HPLC or SFC analysis. Optical rotations
were measured on a Jasco P-2000 polarimeter using a 100 mm path-length cell at 589 $\mathrm{nm} .{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Varian Mercury 300 (at 300 MHz and 75 MHz respectively), a Varian 400 (at 400 MHz and 100 MHz respectively) or a Varian Inova 500 (at 500 MHz and 125 MHz respectively), and are reported relative to internal chloroform $\left({ }^{1} \mathrm{H}, \delta=7.26,{ }^{13} \mathrm{C}, \delta=77.0\right)$. Data for ${ }^{1} \mathrm{H}$ NMR spectra are reported as follows: chemical shift ( $\delta \mathrm{ppm}$ ) (multiplicity, coupling constant $(\mathrm{Hz})$, integration). Multiplicity and qualifier abbreviations are as follows: $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{m}=$ multiplet, $\mathrm{br}=$ broad, $\mathrm{app}=$ apparent. IR spectra were recorded on a Perkin Elmer Paragon 1000 spectrometer and are reported in frequency of absorption $\left(\mathrm{cm}^{-1}\right)$. Preparative HPLC was performed with either an Agilent 1100 or 1200 Series HPLC utilizing an Agilent Zorbax RX-SIL $5 \mu \mathrm{~m}$ column ( $9.4 \times 250 \mathrm{~mm}$ ). Analytical chiral HPLC was performed with an Agilent 1100 Series HPLC utilizing Chiralcel AD or OD-H columns ( $4.6 \mathrm{~mm} \times 25 \mathrm{~cm}$ ) obtained from Daicel Chemical Industries, Ltd with visualization at 254 nm . Analytical SFC was performed with a Mettler SFC supercritical $\mathrm{CO}_{2}$ analytical chromatography system with Chiralcel AD-H and OJ-H columns ( 4.6 mm x 25 cm ). Melting points were determined using a Büchi B-545 capillary melting point apparatus and the values reported are uncorrected. HRMS were acquired using either an Agilent 6200 Series TOF with an Agilent G1978A Multimode source in electrospray ionization (ESI), atmospheric pressure chemical ionization (APCI) or mixed (MM) ionization mode, or obtained from the Caltech Mass Spectral Facility.

### 2.5.2 Substrate Synthesis

General Procedure A. Amination-Heck cascade for synthesis of indole derivatives.

Procedure was adapted from Jørgensen et al. ${ }^{28}$ To a 50 mL Schlenk tube was added $\left[\mathrm{Pd}_{2} \mathrm{dba}_{3}\right]$, dppf, $\mathrm{NaOt} \mathrm{Bu}(20.8 \mathrm{mmol}, 2.5$ equiv) and toluene $(10 \mathrm{~mL})$. The mixture was stirred for 5 minutes, then the bromoiodide ( $8.3 \mathrm{mmol}, 1.0$ equiv) and allylamine ( 8.3 $\mathrm{mmol}, 1.0$ equiv) were added. The tube was sealed, heated to $140^{\circ} \mathrm{C}$ over 30 minutes and stirred at $140^{\circ} \mathrm{C}$ for 21 h . The reaction was then cooled to room temperature, diluted with 40 mL hexanes, filtered through a plug of celite, and concentrated under reduced pressure. The crude residue was purified by flash chromatography.

General Procedure B. $\boldsymbol{N}$-methylation of indole derivatives.

In a flame-dried flask, the indole ( $1.7 \mathrm{mmol}, 1.0$ equiv) was dissolved in 11 mL THF. Sodium hydride ( $60 \% \mathrm{w} / \mathrm{w}, 2.5 \mathrm{mmol}, 1.5$ equiv) was added in one portion, then methyl iodide ( $3.4 \mathrm{mmol}, 2.0$ equiv) was added dropwise. The reaction was stirred at room temperature until consumption of starting material was observed by TLC. The reaction was diluted with ethyl acetate and the excess NaH was quenched with water. The organic layer was separated, and the aqueous layer was extracted $3 \times$ with ethyl acetate. The combined organic layers were washed with brine, dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and
concentrated under reduced pressure. The crude residue was purified by flash chromatography.

## 5-Fluoro-3-methyl-1H-indole (128b).

Prepared from 3.75 mmol of 2-bromo-4-fluoro-1-iodobenzene, $0.63 \mathrm{~mol} \%$ $\left[\mathrm{Pd}_{2} \mathrm{dba}_{3}\right]$ and $2.5 \mathrm{~mol} \%$ dppf using general procedure A . The product was purified by flash chromatography (10\% ethyl acetate/hexanes) to yield 5-fluoro-3-methyl-1H-indole ( $\mathbf{1 2 8 b}, 0.22 \mathrm{~g}, 38 \%$ yield). Spectral data matches that reported in the literature. ${ }^{28}$

## 5-Fluoro-1,3-dimethyl-1H-indole (105b).

Prepared from 1.07 mmol of 5-fluoro-3-methyl- 1 H -indole using general procedure B. The product was purified by flash chromatography (3\% ethyl acetate/hexanes) to yield $\mathbf{1 0 5 b}\left(0.97 \mathrm{~g}, 55 \%\right.$ yield) as a pale yellow oil. ${ }^{1} \mathrm{H}$ NMR ( 500 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.23-7.13(\mathrm{~m}, 2 \mathrm{H}), 7.00-6.92(\mathrm{~m}, 1 \mathrm{H}), 6.86(\mathrm{~s}, 1 \mathrm{H}), 3.72(\mathrm{~s}, 3 \mathrm{H}), 2.29$ $(\mathrm{s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (125 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta 153.6,132.4,128.8,127.2,111.6,109.8,109.5$, 100.8, 32.6, 9.6. IR (NaCl/thin film): 2918, 1581, 1493, 1457, 1423, 1225, 1062, $786 \mathrm{~cm}^{-}$ ${ }^{1}$; HRMS (MM: ESI-APCI) calc'd for $[\mathrm{M}+\mathrm{H}]^{+} 164.0870$, found 164.0873 .

## 3,5-dimethyl-1H-indole (128c).

 was purified by flash chromatography ( $5 \rightarrow 13 \%$ ethyl acetate/hexanes) to yield 3,5-dimethyl-1 H -indole ( $\mathbf{1 2 8 c}, 0.11 \mathrm{~g}, 14 \%$ yield). Spectral data matches that reported in the literature. ${ }^{28}$

## 1,3,5-trimethyl-1H-indole (105c).

Prepared from 0.70 mmol of 3,5 -dimethyl- 1 H -indole using general procedure B. The product was purified by flash chromatography ( $2 \%$ ethyl acetate/hexanes) to yield $\mathbf{1 0 5 c}\left(0.048 \mathrm{~g}, 43 \%\right.$ yield) as a colorless oil. ${ }^{1} \mathrm{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.38-7.34(\mathrm{~m}, 1 \mathrm{H}), 7.18(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H}), 7.05(\mathrm{dd}, J=8.3,1.4 \mathrm{~Hz}$, $1 \mathrm{H}), 6.78(\mathrm{~s}, 1 \mathrm{H}), 3.71(\mathrm{~s}, 3 \mathrm{H}), 2.49(\mathrm{~s}, 3 \mathrm{H}), 2.31(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $\left.125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $135.4,128.8,127.6,126.6,123.0,118.6,109.5,108.7,32.5,21.5,9.5 . \mathrm{IR}(\mathrm{NaCl} /$ thin film): 2918, 1494, 1460, 1388, 1298, 1250, 1149, 1058, 885, 866, $784 \mathrm{~cm}^{-1}$; HRMS (MM: ESI-APCI) calc'd for $[\mathrm{M}+\mathrm{H}]^{+} 160.1121$, found 160.1116.

## 5-Bromo-1,3-dimethyl-1H-indole (105d).

Prepared from 0.95 mmol of 5-bromo-3-methyl- 1 H -indole ${ }^{30}$ using general procedure B. The product was purified by flash chromatography (5\% ethyl acetate/hexanes) to yield $\mathbf{1 0 5 d}\left(0.20 \mathrm{~g}, 90 \%\right.$ yield) as a pale yellow oil. ${ }^{1} \mathrm{H}$ NMR (500 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.70(\mathrm{~d}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.30(\mathrm{dd}, J=8.6,1.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.14(\mathrm{~d}, J=8.6$ $\mathrm{Hz}, 1 \mathrm{H}), 6.82(\mathrm{~s}, 1 \mathrm{H}), 3.70(\mathrm{~s}, 3 \mathrm{H}), 2.30(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (125 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta$ 135.6, 130.3, 127.7, 124.1, 121.5, 111.9, 110.5, 109.7, 32.6, 9.4. IR (NaCl/thin film): 2918, 1563, 1479, 1422, 1279, 812, $785 \mathrm{~cm}^{-1}$; HRMS (APCI) calc'd for $[\mathrm{M}+\mathrm{H}]^{+} 224.0069$, found 224.0070.
$N$-allyl-2-bromo-5-methylaniline (129).

Procedure was adapted from Sørensen and Pombo-Villar. ${ }^{31}$ To a solution of 2-bromo-5-methylaniline ( $10.8 \mathrm{mmol}, 1.0$ equiv) in 29 mL THF at $-78^{\circ} \mathrm{C}$ was added $\mathrm{MeLi}(2.9 \mathrm{M}$ solution in dimethoxymethane, $11.8 \mathrm{mmol}, 1.1$ equiv), and stirred for 30 minutes. Allyl bromide was added dropwise, followed by
stirring at $-78{ }^{\circ} \mathrm{C}$ for 10 minutes, then at room temperature for 5 hours. Then saturated $\mathrm{NaHCO}_{3 \text { (aq) }}$ solution was added, and the aqueous layer was extracted with ethyl acetate $3 \times$. The combined organic layers were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and concentrated under reduced pressure. The crude residue was purified by flash chromatography ( $0 \rightarrow 10 \%$ ethyl acetate/hexanes) to yield $N$-allyl-2-bromo-5-methylaniline (129, $1.63 \mathrm{~g}, 67 \%$ yield) as a yellow oil. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.30(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.46(\mathrm{~d}, J=1.5$ $\mathrm{Hz}, 1 \mathrm{H}), 6.41(\mathrm{ddd}, J=8.0,2.0,0.6 \mathrm{~Hz}, 1 \mathrm{H}), 5.97(\mathrm{ddt}, J=17.2,10.4,5.2 \mathrm{~Hz}, 1 \mathrm{H}), 5.31$ $(\mathrm{ddd}, J=17.2,3.3,1.7 \mathrm{~Hz}, 1 \mathrm{H}), 5.21(\mathrm{dq}, J=10.3,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.41(\mathrm{~s}, 1 \mathrm{H}), 3.83(\mathrm{~s}$, 2H), 2.27 ( $\mathrm{s}, 3 \mathrm{H}$ ); ${ }^{13} \mathrm{C}$ NMR (100 MHz, $\mathrm{CDCl}_{3}$ ) $\delta$ 144.4, 138.4, 134.7, 132.0, 118.8, 116.3, 112.4, 106.5, 46.2, 21.5. ## 1-methyl-3-t-butyldimethylsiloxyethyl-1H-indole (105f).

Prepared from 2.66 mmol of 3 - $t$-butyldimethylsiloxyethyl- 1 H -indole ${ }^{32}$ using general procedure B. The product was purified by flash chromatography ( $0 \rightarrow 5 \%$ ethyl acetate/hexanes) to yield $\mathbf{1 0 5 f}(0.67 \mathrm{~g}, 87 \%$ yield $)$ as an orange oil. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.63(\mathrm{dt}, J=7.9,1.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.31(\mathrm{dt}, J=8.2$, $0.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.26-7.23(\mathrm{ddd}, J=8.1,6.9,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.13(\mathrm{ddd}, J=7.9,6.9,1.0 \mathrm{~Hz}$, $1 \mathrm{H}), 6.91(\mathrm{~s}, 1 \mathrm{H}), 3.90(\mathrm{t}, \mathrm{J}=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 3.76(\mathrm{~s}, 3 \mathrm{H}), 3.02(\mathrm{ddd}, J=7.9,7.1,0.8 \mathrm{~Hz}$, 2H), 0.95 ( $\mathrm{s}, 9 \mathrm{H}$ ), $0.08(\mathrm{~s}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 136.8,128.1,126.9$, $121.4,119.0,118.6,111.5,109.1,64.1,32.5,29.0,26.0,18.4,-5.3$; IR ( $\mathrm{NaCl} /$ thin film):

## 1-methyl-3-ethynylindole (113).

To a solution of 1-Boc-3-(trimethylsilylethynyl)indole ${ }^{33}$ (130, $290 \mathrm{mg}, 0.930 \mathrm{mmol}, 1.00$ equiv) in 4.6 mL THF cooled to $0^{\circ} \mathrm{C}$ in an ice bath was added LAH ( 2 M in THF, 1.1 $\mathrm{mL}, 2.2 \mathrm{mmol}, 2.4$ equiv). After 2 h stirring at $0^{\circ} \mathrm{C}$, the reaction mixture was subjected to a standard Fieser workup. The crude residue was then dried under hi-vacuum, then redissolved in 4.6 mL THF. NaH ( $60 \mathrm{wt} \%$ dispersion in oil, $56 \mathrm{mg}, 1.4 \mathrm{mmol}, 1.5$ equiv) was then added and the reaction was then cooled to $0^{\circ} \mathrm{C}$ in an ice bath, followed by addition of MeI ( $116 \mu \mathrm{~L}, 1.86 \mathrm{mmol}, 2.00$ equiv). The reaction mixture was then allowed to warm to room temperature and stirred for 3 hours, then cooled to $0^{\circ} \mathrm{C} . \mathrm{MeOH}$ was added to quench the reaction, followed by dilution with $\mathrm{H}_{2} \mathrm{O}$, and extraction with DCM (3 x). The combined organic layers were then dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated. The crude oil was subjected to silica gel column chromatography (0:100 to 5:95 EtOAc:hexanes) to yield 23.1 mg ( $16 \%$ yield containing impurities) of 1-methyl-3ethynlindole (113) and 47.8 mg ( $23 \%$ yield) of a compound that is likely 1-methyl-3((trimethylsilyl)ethynyl)indole. The ${ }^{1} \mathrm{H}$ NMR shifts observed for $\mathbf{1 1 3}$ vary slightly from the literature ${ }^{34}$ and are thus listed herein. ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.76-7.72(\mathrm{~m}$, $1 \mathrm{H}), 7.33-7.23(\mathrm{~m}, 3 \mathrm{H}), 7.20(\mathrm{ddd}, J=8.0,6.4,1.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.75(\mathrm{~s}, 3 \mathrm{H}), 3.21(\mathrm{~s}, 1 \mathrm{H})$.

## 2-methyl-3-phenylindole (133).

2-methyl-3-phenylindole (133) was prepared by a procedure adapted from Beller and coworkers. ${ }^{35}$ A flame-dried 25 mL Schlenk tube was charged with $\mathrm{Zn}(\mathrm{OTf})_{2}(0.546 \mathrm{~g}$, $1.50 \mathrm{mmol}, 1.00$ equiv) and flushed with argon. 4 mL THF, phenylhydrazine (132, 191 $\mu \mathrm{L}, 1.95 \mathrm{mmol}, 1.30$ equiv), and 3-phenyl-1-propyne (131, $187 \mu \mathrm{~L}, 1.50 \mathrm{mmol}, 1.00$ equiv) were added in that order and the Schlenk tube was then sealed and heated to 100 ${ }^{\circ} \mathrm{C}$. After stirring at $100{ }^{\circ} \mathrm{C}$ for 25.5 hours, the reaction mixture was allowed to cool to room temperature, and concentrated. The crude residue was purified by silica gel column chromatography to yield 282 mg ( $90 \%$ yield) of 2-methyl-3-phenylindole (133). Spectral data were in agreement with the literature. ${ }^{21}$

## 1-methyl-3-phenyl-2-(trimethylsilyl)indole (119).

A solution of 3-phenyl-2-(trimethylsilyl)indole ${ }^{36}(\mathbf{1 3 4}, 228 \mathrm{mg}, 0.859 \mathrm{mmol}, 1.00$ equiv) in 20 mL THF was cooled to $0^{\circ} \mathrm{C}$ in an ice bath under argon, followed by addition of NaH ( $60 \mathrm{wt} \%$ dispersion in oil, $41 \mathrm{mg}, 1.7 \mathrm{mmol}, 2.0$ equiv). After stirring 15 minutes at $0^{\circ} \mathrm{C}$, $\mathrm{MeI}(107 \mu \mathrm{~L}, 1.72 \mathrm{mmol}, 2.00$ equiv) was added and the reaction was allowed to warm to room temperature. After stirring 20 hours at room temperature, the reaction mixture was cooled to $0{ }^{\circ} \mathrm{C}$ and quenched with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ then diluted with $\mathrm{Et}_{2} \mathrm{O}$. The organic layer was washed (saturated aqueous $\mathrm{NaHCO}_{3}$ then brine), dried
$\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated. The crude residue was purified by column chromatography to yield $63 \mathrm{mg} \quad(26 \%$ yield $)$ of 1-methyl-3-phenyl-2(trimethylsilyl)indole (119). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.47-7.35(\mathrm{~m}, 7 \mathrm{H}), 7.30$ (ddd, $J=8.2,6.8,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.10(\mathrm{ddd}, J=7.9,6.8,1.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.94(\mathrm{~s}, 3 \mathrm{H}), 0.22(\mathrm{~s}$, 9H).

### 2.5.3 General Procedure C. Formal $(3+2)$ Cycloaddition of Indoles and Acrylates

To a flame-dried flask was added indole ( $0.20 \mathrm{mmol}, 1.00$ equiv), acrylate ( 0.20 mmol, 1.00 equiv), and ( $R$ )-BINOL ( $0.04 \mathrm{mmol}, 0.20$ equiv). The flask was charged with DCM ( 1.5 mL ), followed by addition of $\mathrm{SnCl}_{4}(0.24 \mathrm{mmol}, 1.20$ equiv unless specifically indicated, 1 M in DCM ), then stirred at room temperature. The reaction was quenched by diluting with 1 mL MeCN and 1 mL 1 M HCl , followed by addition of $5 \mathrm{~mL} \mathrm{H}_{2} \mathrm{O}$. The aqueous layer was extracted with ethyl acetate ( $3 \times 5 \mathrm{~mL}$ ) and the combined organic layers were washed with either saturated $\mathrm{NaHCO}_{3(\mathrm{aq})}$ or $1 \mathrm{M} \mathrm{NaOH}_{(\mathrm{aq})}(10 \mathrm{~mL})$. The aqueous layer was back extracted with EtOAc $(10 \mathrm{~mL})$ and the combined organic layers were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated. The crude residue was purified by flash chromatography.

## Pyrroloindoline 100b.

Screen varying ( $R$ )-BINOL loading. All reactions were run at room temperature for 3 h in DCE with 1,3-dimethyl- 1 H -indole ${ }^{37}$ (75, 0.2 mmol, 1 equiv), methyl 2-acetamidoacrylate ${ }^{38}$ (91a, $0.2 \mathrm{mmol}, 1$
 equiv) and $\mathrm{SnCl}_{4}$ (1.2 equiv, 1 M in DCM ) Purified by flash chromatography ( $0 \rightarrow 50 \%$ ethyl acetate/hexanes). The diastereomeric (b) endo diastereomer ratio was determined by ${ }^{1} \mathrm{H}$ NMR analysis of the crude reaction mixture. The diastereomers were separated by flash chromatography ( $30 \rightarrow 50 \%$ ethyl acetate/hexanes). The enantiomeric excess was determined for both diastereomers by chiral SFC analysis (AD-H, $2.5 \mathrm{~mL} / \mathrm{min}, 10 \%$ IPA in hexanes, $\lambda=254 \mathrm{~nm}$ ).

(a) exo diastereomer

(b) endo diastereomer

Prepared from 1,3-dimethyl-1H-indole 75 and methyl 2trifluoroacetamidoacrylate ${ }^{39}$ 91b using general procedure C (with DCE as the solvent). The reaction was allowed to run for 4 h . The crude residue was purified by flash chromatography ( $20 \rightarrow 35 \%$ ethyl acetate/hexanes) to yield 53.0 mg ( $77 \%$ yield) of $\mathbf{1 0 0 c}$ in a $6: 1$ ratio of diastereomers (determined by ${ }^{1} \mathrm{H}$ NMR analysis of the purified product). The diastereomers were separated by preparatory HPLC ( $0 \rightarrow 8 \%$ ethyl acetate/hexanes).

Exo diastereomer: pale yellow oil that crystallized upon standing in the fridge to give crystals suitable for single crystal X-ray diffraction. ## Pyrroloindoline 106j.

Prepared from 3-methyl-1 H -indole $(0.15 \mathrm{mmol})$ and benzyl 2trifluoroacetamidoacrylate ( $\mathbf{9 1 d}, 0.15 \mathrm{mmol}$ ) using general procedure C. The reaction was allowed to run for 5.5 h . The crude residue was purified by flash chromatography ( $0 \rightarrow 20 \%$ ethyl acetate/hexanes) to yield 10.7 mg ( $18 \%$ yield) of $\mathbf{1 0 6 j}$ in an $8: 1$ ratio of diastereomers (determined by NMR analysis of the pure product). The diastereomers were separated by prepatory HPLC (5 $\rightarrow 12 \%$ ethyl acetate/hexanes).

### 2.5.5 Pd-catalyzed Deallylaton of Pyrroloindoline Methyl Ester 107

An oven-dried microwave vial was charged with allylpyrroloindoline 107 ( 55.0 mg , $0.149 \mathrm{mmol}, 1.00$ equiv), $\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(6.9 \mathrm{mg}, 6.0 \mu \mathrm{~mol}, 0.040$ equiv), and $N, N-$ dimethylbarbituric acid $(70.0 \mathrm{mg}, 0.448 \mathrm{mmol}, 3.01$ equiv) then sealed under nitrogen. 1.1 mL DCM was added and the reaction mixture was heated to $35^{\circ} \mathrm{C}$ in an oil bath. Two additional 7.0 mg portions of $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ were added after 34 hours and after 75 hours. After heating at $35^{\circ} \mathrm{C}$ for 123 hours, the reaction was concentrated and the crude residue was diluted in $\mathrm{Et}_{2} \mathrm{O}$, washed with saturated aqueous $\mathrm{Na}_{2} \mathrm{CO}_{3}$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated. The crude residue was subjected to silica gel column chromatography (10:90 EtOAc:hexanes) to yield 34.8 mg ( $71 \%$ yield) of $\mathbf{1 0 8}$ as a colorless oil in an $8: 1$ mixture of diastereomers (determined by NMR analysis of the pure product). A 10 mL flame-dried flask was charged with ( $R$ )-BINOL ( $11.4 \mathrm{mg}, 39.9 \mu \mathrm{~mol}, 0.20$ equiv), methyl 2-acetamidoacrylate ( $\mathbf{9 1 a}, 28.6 \mathrm{mg}, 0.200 \mathrm{mmol}, 1.00$ equiv), and 1,2-dimethyl-3-phenylindole ${ }^{46}$ ( $\mathbf{1 1 7}, 44.2 \mathrm{mg}, 0.200 \mathrm{mmol}, 1.00$ equiv). $\mathrm{MeOH}(40 \mu \mathrm{~mol}$, 0.20 equiv) was then added as a solution in 1.5 mL DCM (from a stock solution of $16 \mu \mathrm{~L}$ MeOH in 15 mL DCM), followed by $\mathrm{SnCl}_{4}(1 \mathrm{M}$ solution in $\mathrm{DCM}, 240 \mu \mathrm{~L}, 0.240 \mathrm{mmol}$, 1.20 equiv). After stirring in the dark 12.5 hours, the orange reaction mixture was diluted with 4 mL MeCN and 5 mL EtOAc , then washed with 10 mL of 0.1 M HCl in brine. The aqueous layer was extracted with 5 mL EtOAc and the combined organic layers were washed with 10 mL 1 M aqueous NaOH . The aqueous layer was extracted with 5 mL

EtOAc and the combined organic layers were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated. The crude residue was purified by silica gel column chromatography (0:100 to 40:60 EtOAc:hexanes) to yield 29 mg ( $40 \%$ yield) of 3a-phenylpyrroloindoline $\mathbf{1 1 8}$ as a pale yellow oil. ### 2.5.9 General Procedure D. Epimerization Studies

To an NMR tube was added a solution of pyrroloindoline $\mathbf{1 0 0 e}$ ( $0.063 \mathrm{mmol}, 1.00$ equiv) in $\mathrm{CD}_{2} \mathrm{Cl}_{2}(0.46 \mathrm{~mL})$, followed by $\mathrm{DBU}(0.63 \mathrm{mmol}, 10.00$ equiv). The reaction was monitored by ${ }^{1} \mathrm{H}$ NMR until the ratio of diastereomers reached an equilibrium. At this point the reaction was diluted with $3 \mathrm{mLCHCl}_{3}$ and 25 mL ethyl acetate and washed with saturated $\mathrm{NaHCO}_{3(\text { (aq })}(3 \times 15 \mathrm{~mL})$. The organic layer was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated to give the mixture of pyrroloindoline diastereomers as a pale yellow oil with quantitative recovery of material.

Experiment 1: Treatment of a $4: 1$ mixture of exo-100e (94\% ee) $+\boldsymbol{e n d o}-\mathbf{1 0 0 e}$ ( $91 \%$ ee) with DBU (10 equiv) for 65 h to give $>10: 1$ ent-endo-100e ( $56 \% \mathrm{ee}$ ).

Experiment 2: Treatment of diastereomerically pure exo-100e (94\% ee) with DBU (10 equiv) for 96 h to give $>10: 1$ ent-endo-100e ( $94 \% \mathrm{ee}$ ).

Experiment 3: Treatment of diastereomerically pure endo-100e (91\% ee) with DBU (10 equiv) for 30 h to return $\boldsymbol{e n d o}$-100e ( $89 \% \mathrm{ee}$ ).

### 2.5.10 Resubjection of Pure Exo and Endo Pyrroloindolines to Reaction <br> Conditions

To an NMR tube was added a solution of pure pyrroloindoline exo-100e (0.073 mmol, 1.00 equiv, $94 \%$ ee) in $\mathrm{CD}_{2} \mathrm{Cl}_{2}(297 \mu \mathrm{~L})$, followed by $(R)$-BINOL (from a 0.0675 M solution in $\mathrm{CD}_{2} \mathrm{Cl}_{2}, 0.015 \mathrm{mmol}, 0.20$ equiv) and $\mathrm{SnCl}_{4}$ (from a 0.72 M solution in $\mathrm{CD}_{2} \mathrm{Cl}_{2}, 0.088 \mathrm{mmol}, 1.2$ equiv). After 4 h at room temperature, the solution was quenched according to general procedure C . The same experiment was performed with pure endo-100e ( $91 \%$ ee), except at a concentration of 0.065 M . In both cases, no epimerization or erosion of ee was observed.
