## ACKNOWLEDGEMENTS

First of all, I would like to thank my thesis advisor, Professor Brian Stoltz, for his support and enthusiasm over the past few years. Looking back, I was pretty lucky that Brian even let me join his lab in the first place. Brian knew I had little synthetic experience but still decided to take me into his group. He spent an enormous amount of time working with me that first summer getting me up to speed on lab technique and teaching me how to be an experimentalist. Learning synthesis from Brian first-hand in the early years was certainly one of the most fun and valuable experiences I had in graduate school. Over the more recent years, Brian has continued to be a role model, mentor, and friend to me. Being a part of the Stoltz group has been a great honor. Although I am sad to be leaving, I am looking forward to the future and will enjoy watching the lab develop during the upcoming years.

The other members of my thesis committee have been a true pleasure to interact with. Professor David Tirrell, the chair of my committee, could be the most well-organized person I have ever met. He heads the chemistry department, maintains his own research laboratory and, somehow, still finds time to read over candidacy reports and research proposals with a fine-toothed comb. Professor David MacMillan has also been incredibly supportive. He has provided me with scientific insight numerous times, particularly during my candidacy and proposal exams. I will always appreciate his willingness to share equipment and closely interact with our lab (MOM meetings, etc.), especially during the early days. Although Professor Peter Dervan is the newest member of my committee, I have already gotten to know him quite well. Sitting in on his bioorganic class this past year was a great learning experience for me. Most of all, I value his highly interactive teaching style and the philosophical discussions he promotes.

My undergraduate chemistry teachers also deserve special thanks. My roots as a researcher come from Professor Marc Walters at NYU. He was always full of sound advice and was able to foster a great learning environment for undergraduate students; Kev Adjemian, Steven Damo, and Ray Doss were a blast to work with. I also must thank

Professor Yorke Rhodes for his sound advice over the years. His love for organic chemistry and teaching was truly inspiring.

During my time at Caltech I have had the privilege of working closely with many people. Dr. Richmond Sarpong (a.k.a., sars) arrived in Pasadena in November 2000. He crashed on my sofa for a little while, used my deodorant, and bought a BMW to impress the ladies. Although he pounded me at the ping pong table and on the tennis court, I can grow a thicker beard than he can. I have photos to prove it. As far as lab work goes, Richmond is an exceptional chemist, the best of the best. I was lucky enough to work with him on the dragmacidin D project for nearly two years. In 2003, Dan Caspi (a.k.a., caspo, monk) joined team dragmacidin and, together, he and I worked on dragmacidin F. Dan brought a lot of great ideas and discoveries to the project, which made working together exciting at all times. Outside of the lab, Dan has become a close friend of mine. He's a pretty funny guy too. I once overheard a conversation he was having with a worker at Jamba Juice-'You see, they're enantiomers,' he said. It was a nice try Caspo, but she was too smart for that line. I am indebted to Richmond and Dan for their work on the dragmacidins, but more importantly, for their friendship over the past few years.

I would like to collectively thank the Stoltz group for making our laboratory a great working environment. There are also a number of people whom I would like to acknowledge individually: the original members of the group: Sarah Spessard, Jeremy May, and Eric Ferreira for being a part of the lab in the early days-especially Jeremy whom I have stayed close friends with over the years; Uttam Tambar for his sound advice; J.T. Mohr, Mike Krout, and Dan Caspi for good times at the Taco Truck; everyone in 204 Church for keeping things exciting on a daily basis (yes, that includes you, Roizen); Haiming Zhang, Sekar Govindasamy, and Taichi Kano for their knowledge and encouragement. I am also grateful to all of my labmates who have proofread sections of this thesis: Dan Caspi, Jeremy May, Mike Krout, J.T. Mohr, David Ebner, Ernie Cruz, Uttam Tambar, Ryan McFadden, Eric Ferreira, and Eric Ashley. The last person in the Stoltz lab whom I would like to thank individually is Raissa Trend, my baymate for the past few years. I am grateful to Raissa for just about all of the items listed above, but especially for her support, encouragement, and friendship. Raissa's skills as a scientist and
critical thinker are outstanding. I've learned so much from her, and I will really miss working with her.

The Dervan lab has been like a second home to me. The students are exceptionally talented and kind, and not a single one of them has ever refused to lend a hand my way. Their willingness to share equipment and their expertise in handling polar compounds were crucial to the dragmacidin project. Special thanks go to Raymond Doss, Michael Marques, Shane Foister, Victor Rucker, Ryan Stafford, James Puckett, Adam Kerstien, Sanchez, Ben Edelson, Bogdan Olenyuk, and Eric Fechter. I've known Ray since freshman year at NYU, where he earned the nickname, 'the mailman.' Yes, he always delivers.

The list of people I would like to thank goes on and on. The MacMillan lab has also been extremely helpful, particularly when we got started. I have many fond memories from those days, especially from time spent with my indole counterpart Joel Austin (a.k.a., jdogg). From the Grubbs group, JP Morgan, Arnab Chatterjee, Andrew Waltman, and Brian Connell were incredibly helpful. I've had many great conversations with Jon Owen in the Bercaw group, and his assistance with the 500 has been invaluable. From the Dougherty group, I must thank James Petersson for all that he has taught me. I am also indebted to Chris Lacenere from the Quake lab for introducing me to the world of the biologique. I would also like to thank Tara Suntoke from the Chan lab for running bioassays and Jeremy Weaver from the Gray group for obtaining circular dichroism spectra on multiple occasions.

The staff at Caltech is superb. For facilities, I would like to thank Scott Ross in the NMR lab. If you've ever heard Scott talk about NMR, you know he's the best in the business. He's a great teacher, and his passion for his work is incredible. Mona Shahgholi (Caltech) and John Greaves (UC Irvine) are acknowledged for their assistance in obtaining mass spectral data. I would also like to thank Larry Henling and Mike Day for solving several crystal structures for the dragmacidin project. I am indebted to Tom Dunn for everything he has helped with over the years, especially with regards to Hg 3 . I'd like to thank Rick Gerhart and Mike Roy for many great conversations. I've also enjoyed time spent with the guys in the chemistry stockroom, Joe Drew, Moises Renteria, and Terry

James, especially the trips to Lee's Hoagie House. Lynne Martinez and Linda Syme have always been good to me. And where would we all be without Dian Buchness?

This thesis certainly would not have been possible without the love and encouragement of my family and friends. My mom and dad have always been incredibly compassionate, and my brother Bobby and his wife Biraj have been equally caring. Finally, I want to give my deepest thanks to my fiancee Lindsey. She has been my best friend for many years and, without her, I would have had a tough time making it through graduate school. Her patience, love, and support mean the world to me.

#### Abstract

The dragmacidins are an emerging class of bis(indole) natural products isolated from deep-water marine organisms. Although there has been a substantial effort to prepare the simple piperazine dragmacidins, little synthetic work has been done in the area of the pyrazinone-containing family members, dragmacidins $\mathrm{D}, \mathrm{E}$, and F . These compounds are particularly interesting due to their complex structures and broad range of biological activity.

A highly convergent strategy to access dragmacidin D has been developed. In this approach, sequential halogen-selective Suzuki couplings were used to assemble the carbon scaffold of the natural product. After executing a highly optimized sequence of final events, the first completed total synthesis of dragmacidin D was achieved.

An enantiodivergent strategy for the total chemical synthesis of both (+)- and (-)dragmacidin F from a single enantiomer of quinic acid has been developed and successfully implemented. Although unique, the synthetic routes to these antipodes share a number of key features, including novel reductive isomerization reactions, $\mathrm{Pd}(\mathrm{II})$-mediated oxidative carbocyclization reactions, halogen-selective Suzuki couplings, and high-yielding latestage Neber rearrangements.

The formal total syntheses of dragmacidin B , trans-dragmacidin C , and dihydrohamacanthin A are described. In addition, preliminary studies involving a novel approach for the preparation of dragmacidin E are reported.

## CHAPTER ONE

## The Dragmacidins: A Family of Biologically Active Marine Alkaloids

### 1.1 Introduction

### 1.1.1 Bis(indole) Alkaloids

Over the past several decades, the search for natural products in marine and terrestrial environments has led to the discovery of a number of biologically active bis(indole) alkaloids. ${ }^{1}$ These compounds, as well as their unnatural analogs, have shown promise as leads for the development of novel therapeutics. Several representative bis(indole) compounds are shown below in Figure 1.1.1. ${ }^{2}$

Figure 1.1.1

Staurosporine protein kinase C inhibition

Yuehchukene anti-implantation activity

Conophylline pancreatic $\beta$-cell regeneration

Vinblastine anti-neoplastic

Although many bis(indole) alkaloids have been found in nature, relatively few have been discovered in marine environments. ${ }^{3}$ Of those, the dragmacidins have received considerable attention from the scientific community over the past decade due to their broad range of biological activity and complex structures (1-7, Figure 1.1.2). ${ }^{4,5}$ Several closely related bis(indole) natural products have been discovered in similar environments, such as the topsentins (e.g., 8) ${ }^{4 \mathrm{~b}, 6}$ and the hamacanthins (e.g., 9). ${ }^{7}$

Figure 1.1.2

Isobromotopsentin (8)

Hamacanthin A (9)

### 1.1.2 The Dragmacidins

The dragmacidins are an emerging class of novel bis(indole) natural products isolated from the deep-water marine sponges Dragmacidon, Halicortex, Spongosorites, and Hexadella, and the tunicate Didemnum candidum. The four dragmacidins initially identified (1-4) contain a piperazine linker and display modest antifungal, antiviral, and cytotoxic activities. ${ }^{4 a-c}$ However, our interest in these natural products was piqued by the structurally complex pyrazinone-containing family members, dragmacidins D (5), E (6), and F (7). ${ }^{4 \mathrm{~d}-\mathrm{g}}$ Although the relative stereochemistry of 1-7 was known, at the onset of our investigations, the absolute stereochemistry of 1-7 had not been established.

### 1.2 Biological Activity of Pyrazinone-Containing Dragmacidins

The following section describes the wide range of biological activity associated with the pyrazinone-containing dragmacidins, D (5), E (6), and F (7). Preliminary studies suggest that these compounds are interesting from a biological standpoint and are therefore attractive targets for total synthesis. Synthetic routes to the pyrazinone dragmacidins could facilitate the production of sufficient quantities of material needed for advanced biological studies.

### 1.2.1 Inhibitors of Protein Phosphatases

### 1.2.1.1 Activity of Dragmacidins

In 1998, Capon et al. reported that dragmacidins $\mathrm{D}(\mathbf{5})$ and E (6) are potent inhibitors of serine-threonine protein phosphatases (PP). ${ }^{4 e}$ In addition, preliminary testing showed that dragmacidin $\mathrm{D}(\mathbf{5})$ selectively inhibited PP1 over the PP2A isozyme.

### 1.2.1.2 About Protein Phosphatases

The reversible phosphorylation of proteins containing serine, threonine, and tyrosine residues is widely recognized as a mechanism by which many cellular events are regulated (Figure 1.2.1). ${ }^{8}$ While phosphorylation is catalyzed by protein kinases, dephosphorylation is carried out by protein phosphatases. To date, many phosphatase enzymes have been discovered; however, discerning which phosphatase is responsible for controlling particular cellular pathways has remained an elusive goal. In particular, distinguishing the action of the PP1 and PP2A isozymes has been extremely difficult. Ultimately, the discovery of small molecules that display selective PP inhibition could help elucidate the mechanism of many physiological processes including cell division, gene expression, neurotransmission, and muscle contraction. ${ }^{8 c}$

Figure 1.2.1

### 1.2.2 Inhibitors of Neural Nitric Oxide Synthase

### 1.2.2.1 Activity of Dragmacidins

Dragmacidin D (5) has also been shown to selectively inhibit neural nitric oxide synthase (nNOS) in the presence of inducible nitric oxide synthase (iNOS). ${ }^{9}$ The ability to efficiently prepare dragmacidin D , and related derivatives thereof, could be extremely valuable for the discovery of novel drugs that target neurodegenerative disorders.

### 1.2.2.2 About Nitric Oxide Synthase

The production of nitric oxide (NO) in the human body is known to be associated with the regulation of a number of physiological properties. ${ }^{10} \mathrm{NO}(\mathbf{1 3})$ arises from the decomposition of L-arginine (10) by an enzyme known as nitric oxide synthase (NOS) $(\mathbf{1 0} \rightarrow \mathbf{1 1} \rightarrow \mathbf{1 2}+\mathbf{1 3}$, Scheme 1.2.1). This enzyme occurs in three main isoforms: a) inducible NOS (iNOS), which generates NO during the immune response where NO acts as a cytotoxic molecule, b) endothelial NOS (eNOS), which produces NO for vasodilatation, and c) neuronal NOS (nNOS), which provides NO involved in neuronal physiology. Although NO provides many beneficial functions, the overproduction of NO in the brain has been linked to a number of neurodegenerative disorders. Thus, the ability to selectively inhibit nNOS may be useful for the treatment of related illnesses, including Alzheimer's, Parkinson's, and Huntington's diseases. ${ }^{11}$

Scheme 1.2.1

### 1.2.2.3 Aminoimidazoles as Inhibitors

Compounds bearing aminoimidazole functionality are an attractive class of NOS inhibitors since, when protonated, they resemble the guandinium system present in $\operatorname{arginine}(\mathbf{1 0}){ }^{12} \quad$ Therefore, the aminoimidazole moiety of dragmacidin $\mathrm{D}(\mathbf{5})$ could potentially be responsible for its reported NOS activity through competitive inhibition. It is possible that the other aminoimidazole-containing dragmacidins ( 6 and 7) could display similar activity, although studies in this area have not appeared in the literature.

### 1.2.3 Miscellaneous Biological Activity

### 1.2.3.1 Cytotoxicity

Many bis(indole) compounds discovered in nature have shown promise as leads in the search for new anti-cancer medicines. Although its mechanism of action is not known, dragmacidin $\mathrm{D}(\mathbf{5})$ shows cytotoxicity against several human lung tumor cell lines. ${ }^{4 d}$ Dragmacidins E (6) and F (7), on the other hand, have not yet been evaluated for anti-neoplastic activity.

### 1.2.3.2 Antiviral and Anti-Inflammatory Properties

Dragmacidin F (7) is reported to exhibit in vitro antiviral activity against herpes simplex virus $\left(\mathrm{HSV}-\mathrm{I} ; \mathrm{EC}_{50}=95.8 \mathrm{mM}\right)$ and human immunodeficiency virus (HIV-I; $\left.\mathrm{EC}_{50}=0.91 \mathrm{mM}\right){ }^{4 \mathrm{f}}$ In addition, dragmacidins $\mathrm{D}(\mathbf{5})$ and $\mathrm{F}(7)$ display anti-inflammatory activity in resiniferatoxin-induced inflammation of the mouse ear. ${ }^{13,4 \mathrm{~g}}$

### 1.3 Biosynthesis of Dragmacidins

### 1.3.1 Biosynthesis of Piperazine Dragmacidins and Dragmacidin D

The biosynthesis of the dragmacidins has not been studied in detail. ${ }^{14}$ However, in the 1960s, MacDonald and co-workers examined the origin of simple diketopiperazine natural products. ${ }^{15}$ It was found that disubstituted piperazine derivatives could form via the condensation of two amino acids, L-isoleucine and L-leucine $(\mathbf{1 4}+\mathbf{1 5} \boldsymbol{\rightarrow} \mathbf{1 6}$, Scheme 1.3.1). Based on this work, one could propose that the dragmacidins arise by a related pathway $(\mathbf{1 7 a}+\mathbf{1 7 b} \rightarrow \mathbf{1 8} \rightarrow \mathbf{1 - 5})$. However, the necessary indole-containing amino acids ( $\mathbf{1 7 a}$ and 17b) for this biosynthesis are not known to be naturally occurring.

Scheme 1.3.1

Tryptophan and tryptamine (Scheme 1.3.2), on the other hand, are both commonly found in nature. In fact, 6-bromotryptamine was found in the same marine sponge from which dragmacidin $C$ was isolated. ${ }^{4 c}$ It seems plausible that the dragmacidins could be biosynthetically derived from building blocks of this type (i.e., 19a and 19b). Various oxidations could take place before or after the dimerization event occurs, ${ }^{16}$ eventually leading to formation of the piperazine dragmacidins (1-4). These molecules, or a related derivative, could perhaps be biosynthetically transformed into dragmacidin $\mathrm{D}(5)$.

Scheme 1.3.2

### 1.3.2 Biosynthesis of Dragmacidins E and F

Dragmacidins D, E, and F are likely biosynthetically related. ${ }^{4 \mathrm{f}}$ Of the possible biosynthetic scenarios, most probable is that dragmacidins $\mathrm{E}(\mathbf{6})$ and $\mathrm{F}(7)$ are derived by
cyclization of either dragmacidin $D(\mathbf{5})$ or a closely related congener (Scheme 1.3.3). For example, dragmacidins D and E are isomers that differ by a single $\mathrm{C}-\mathrm{C}$ bond. In nature, it is likely that a Friedel-Crafts cyclization between the pyrazinone and aminoimidazole groups of dragmacidin D occurs in order to construct the seven-membered ring of dragmacidin E (i.e., $\mathbf{5} \rightarrow \mathbf{6}$ ). Dragmacidins D (5) and F (7) also differ in connectivity by one $\mathrm{C}-\mathrm{C}$ bond; however, in this case, there is also a difference in oxidation state between the two natural products. Thus, oxidative dearomatization with concomitant cyclization could facilitate the formation of the unique polycyclic framework present in dragmacidin F (i.e., $5 \rightarrow \mathbf{7}$ ). Related oxidation pathways for tryptophan derivatives have been observed in nature. ${ }^{17}$

## Scheme 1.3.3

### 1.4 Synthetic Studies Relating to the Pyrazinone-Containing Dragmacidins

At the onset of our studies, there was a single report related to the synthesis of the pyrazinone-containing dragmacidins (5-7) by Jiang and Gu. ${ }^{5 g}$ Although the authors claimed to have prepared the bis(indole)pyrazinone scaffold of $\mathbf{5}$ and $\mathbf{6}$, this work was clearly erroneous but was never retracted. ${ }^{18}$

### 1.4.1 Jiang's Approach to the Pyrazinone Core

In 2000, shortly after we began work in the area of the dragmacidin natural products, Jiang and co-workers reported a successful synthetic route to the bis(indole)pyrazinone core of dragmacidins D and E (Scheme 1.4.1). ${ }^{\text {5h }}$ Their strategy involved the elaboration of indole (20) to bis(indole)amide 21 via a series of functional group manipulations. Then, in the final step, intramolecular condensation of amide 21 produced pyrazinone 22a in 23\% yield. Although Jiang's route produced the desired bis(indole) core (22a), it is lengthy and hampered by low yields.

Scheme 1.4.1

### 1.4.2 Horne's Approach to the Pyrazinone Core

In 2002, during the course of our own investigations, a convergent strategy for constructing pyrazinone 22a was reported by Horne (Scheme 1.4.2). ${ }^{5 j}$ Upon exposure to
methanesulfonic acid at $130^{\circ} \mathrm{C}$, aminoketone 23 underwent a cyclocondensation reaction with ketoamide 24 to afford the desired product 22a in $30 \%$ yield. Further work in this area using substituted indoles has yet to be reported.

Scheme 1.4.2

### 1.4.3 Jiang's Approach to the Aminoimidazole Segment of Dragmacidin D

Concurrent with our own work, in 2002 Jiang described a synthesis of the aminoimidazole segment of dragmacidin $D .{ }^{5 i}$ The 4,7-disubstituted indole (25) was prepared in 7 steps from commercially available compounds via a Leimgruber-Batcho indole synthesis (Scheme 1.4.3). ${ }^{19,20}$ Subsequent metallation and quenching with epoxide 26 afforded alcohol 27 in good yield. After manipulations of the indole nitrogen protecting group ( $\mathbf{2 7} \boldsymbol{\rightarrow} \mathbf{2 8}$ ), the $2^{\circ}$ alcohol was oxidized, and the trityl group was removed to produce hydroxyketone 29. Elaboration to bromide 30, followed by exposure to acetylguanidine for 4 days, installed the desired aminoimidazole segment (31) in 32\% yield. At the time of Jiang's publication, our group had already independently prepared 31 and determined that it was not a productive route to dragmacidin D (see Chapter 2, reference 33).

Scheme 1.4.3

### 1.4.4 Jiang's Second Generation Approach to the Pyrazinone Core

Following our publication describing the first total synthesis of dragmacidin D, Jiang reported a similar approach to construct the core of the natural product in the form of a bis(indole)pyrazine (Scheme 1.4.4). ${ }^{5 \mathrm{k}}$ First, dibromopyrazine 32 was cross-coupled with boronic acid $\mathbf{3 3}$ to afford indolopyrazine 34. After switching protecting groups on the indole nitrogen ( $\mathbf{3 4} \rightarrow \mathbf{3 5}$ ), indolopyrazine $\mathbf{3 5}$ was coupled with stannane $\mathbf{3 6}$ to produce a mixture of pyrazine products ( $\mathbf{3 7}-\mathbf{4 0}$ ) in $61 \%$ combined yield. An account describing the elaboration of $\mathbf{3 7 - 4 0}$ to the natural product (5) has yet to appear in the literature.

Scheme 1.4.4

### 1.5 Conclusion

The dragmacidin alkaloids are a unique class of molecules that are interesting from both a biological and structural standpoint. Although there has been synthetic work aimed at the piperazine dragmacidins (1-4), the pyrazinone-containing dragmacidins, D (5), E (6), and F (7), have received little attention from the synthetic community. Ultimately, synthetic routes to these natural products could be extremely valuable in the search for new medicines.

## CHAPTER TWO

## The Total Synthesis of Dragmacidin $D^{\dagger}$

### 2.1 Background

### 2.1.1 Introduction

In 2000, the pyrazinone-containing dragmacidins, namely, dragmacidins D, E, and F , were selected as formidable synthetic targets for our laboratory (Figure 2.1.1). ${ }^{1}$ Initially, we chose to pursue the total synthesis of dragmacidin D (5), ${ }^{\text {aa,b }}$ predominantly because it was believed to be the biosynthetic precursor to dragmacidins $\mathrm{E}(\mathbf{6})$ and $\mathrm{F}(7) .{ }^{\text {1c }}$ In addition, $\mathbf{5}$ appeared to be the simplest of the pyrazinone-containing family members. Thus, we hoped to develop a strategy for the preparation of dragmacidin $D(5)$ that would be amenable to the synthesis of the other complex dragmacidin natural products. ${ }^{2}$

Figure 2.1.1

[^0]When considering the structure of dragmacidin $\mathrm{D}(\mathbf{5})$, several synthetic challenges become apparent. Dragmacidin D possesses a total of seven nitrogen atoms, three of which are incorporated in the aminoimidazole moiety, while two are within the pyrazinone core. The compound contains an unual bis(indole) architecture featuring a 3,4,7-trisubsituted indole and a 3,6-disubstituted indole. Both of these indole substitution patterns are known to be synthetically challenging targets. ${ }^{3}$ It was predicted that dragmacidin D , as well as many of its synthetic precursors, would be highly polar, extremely reactive, and perhaps difficult to handle in a laboratory setting.

### 2.1.2 Retrosynthetic Analysis of Dragmacidin D

Two retrosynthetic strategies for the synthesis of dragmacidin D are presented in Scheme 2.1.1. As a critical maneuver, we chose to introduce the aminoimidazole moiety at a late stage in the synthesis in order to facilitate the handling of key precursors. Thus, disconnection of the aminoimidazole in the natural product (5) provided ether $\mathbf{4 1}$. We then targeted 41 through two complementary routes: i) a classical cyclocondensation approach ${ }^{4}$ and $i i$ ) a more modern transition metal-mediated cross-coupling approach. ${ }^{5}$ In approach $i$, the pyrazinone system would be constructed through the linkage of two functionalized indole units $(\mathbf{4 2}+\mathbf{4 3})$, while in route $i i$, the dragmacidin core was envisioned to arise by a stepwise three-component coupling sequence $(\mathbf{4 4}+\mathbf{4 5}+\mathbf{4 6})$. Both routes relied on the same indole building blocks (48 and 49), which were readily available from simple aromatic starting materials $\mathbf{4 7}$ and 50, respectively.

Scheme 2.1.1

### 2.2 The Cyclocondensation Approach to Access the Bis(indole) Framework

Our initial efforts toward the total synthesis of dragmacidin $D(5)$ focused on the cyclocondensation approach (i). A model system for the preparation of the pyrazinone core (i.e., 22a) was explored. Treatment of indole (20) with oxalyl chloride produced $\mathbf{5 1}$ in high yield (Scheme 2.2.1). ${ }^{6}$ This compound was then employed as a common intermediate for the synthesis of the unsubstituted coupling fragments 52a and 53a. The synthesis of aminoamide 52a proceeded via elaboration of $\mathbf{5 1}$ by a sequence involving: a)
amidation using ammonia, b) oxime formation, and c) reduction using hydrogen, catalyzed by palladium on carbon. Ketoaldehyde 53a was prepared directly by reduction of $\mathbf{5 1}$ with tributyltin hydride. ${ }^{7}$

Scheme 2.2.1

With the key fragments in hand, we investigated the viability of the cyclocondensation reaction (Scheme 2.2.2). Upon exposure to heated aqueous potassium hydroxide, compounds 52a and 53a underwent smooth conversion to the desired pyrazinone 22a in good yield, as the only observed product of the reaction. Under similar conditions, bromide $\mathbf{5 2} \mathbf{b}^{8}$ also participated in the pyrazinone-forming reaction $(53 a+52 b \rightarrow \mathbf{2 2 b})$. However, under our optimized conditions, as well as a variety of others (Bronsted acids and bases, Lewis acids), we were unable to effect cyclocondensative coupling with any $\mathrm{C}(4)$-substituted ketoaldehyde derivative (i.e., 53b). ${ }^{9}$

## Scheme 2.2.2

53a 52b 22b

### 2.3 The Metal-Mediated Strategy to Construct the Bis(indole) Framework

We turned our attention to the alternative retrosynthetic strategy, the transition metal-catalyzed cross-coupling route $i$. The ability to carry the 6 -bromoindole moiety directly through the reaction sequence would be critical for the success of our plan. The synthesis clearly became an issue of strategy involving not only the exact order of the coupling reactions, but also the specific identity of each substrate involved. The appropriate selection of halides, metals, and protecting groups would be crucial. We thus turned our attention toward experiments that would delineate suitable conditions for coupling.

### 2.3.1 The Development of Suitable Conditions for Selective Cross-Couplings

We initially surveyed a variety of coupling reactions involving model indoles and various halogenated pyrazine derivatives in order to assess the relative reactivity of such systems as well as the suitability of the protective groups on the indole nitrogen. It was quickly established that halogenated pyrazines are highly reactive toward palladiummediated couplings to metalated indoles. Furthermore, the oxidative addition of palladium(0) to pyrazinyl halides is more facile than to simple aromatic halides. ${ }^{10}$ For example, reaction of borylated indoles $\mathbf{5 4 a}$ and $\mathbf{5 5}$ with readily available chloropyrazine $56^{11}$ proceeded smoothly at $80{ }^{\circ} \mathrm{C}$ under standard Suzuki conditions to afford coupled products 57 and 58 (Scheme 2.3.1). Under identical conditions, simple aryl chlorides do not readily participate in such couplings. ${ }^{12}$ Additionally, treatment of chloroiodopyrazine 59 with 2 equiv of indole 54a at $23^{\circ} \mathrm{C}$ produced indolylpyrazine $\mathbf{6 0 a}$ exclusively, while raising the temperature to $80^{\circ} \mathrm{C}$ resulted in the formation of the bis(indole)pyrazine 61. A more surprising development was observed upon treatment of pyrazine $\mathbf{5 9}$ with an excess of silylated boronic ester 55 ( 2.3 equiv) at $80^{\circ} \mathrm{C}$. Under these conditions, exclusively monocoupled product was obtained as a mixture of silylated and desilylated compounds ( 60 b and 60 c ). This difference in reactivity points to a remote electronic effect of the indole protecting group on the activation of the intermediate chloroindolylpyrazine (60) toward coupling.

Scheme 2.3.1

Having conducted these simple experiments, we began to identify appropriate substitution patterns for building blocks 44, 45, and 46 (Figure 2.3.1). It was immediately clear that the use of Suzuki couplings would be favorable due to our success in the model systems. Thus, boron substituents were employed as the metal species for both indole substrates ( $\mathbf{4 4}$ and 46). In addition, the protecting groups for indoles 44 and 46 were chosen in a manner that optimized orthogonality with respect to deprotection, which would facilitate control during late-stage manipulations. In particular, the N -
protecting groups were very carefully selected. The SEM group ${ }^{13}$ of $\mathbf{6 2}$ was considered ideal due to its marked stability and electron-donating nature, while the Ts group of $\mathbf{5 4 b}$ was preferred mainly because of its success in the model system studies. Perhaps the most important decision was the selection of halogens $X_{1}$ and $X_{2}$ of pyrazine 45 . Although chloroiodopyrazine $\mathbf{5 9}$ was utilized in the model systems described above, it was believed that replacing the chloride with a bromide would allow for better position selectivity. ${ }^{14}$ Thus, bromoiodopyrazine $\mathbf{6 3}$ was selected as the key synthetic fragment. We then proceeded to develop rapid syntheses of the three essential pieces (62, 63, and 54b).

Figure 2.3.1

### 2.3.2 Synthesis of Pyrazine and Bromoindole Fragments

The key differentially halogenated pyrazine fragment 63 was readily prepared via iodide displacement of the in situ prepared diazonium salt of aminopyrazine $64{ }^{15}$
(Scheme 2.3.2). ${ }^{16}$ Bromoindole boronic acid derivative 54b was synthesized from parent indole $49^{17}$ by protection of the indole nitrogen, ${ }^{18}$ treatment with mercuric acetate, and reaction of the resulting organomercurial (65) with borane•THF complex followed by hydrolytic work-up ( $82 \%$ yield, 3 steps). ${ }^{19}$

Scheme 2.3.2

### 2.3.3 Synthesis of the 3,4,7-Trisubstituted Indole Fragment

The 3,4,7-trisubstituted indole fragment (62) was synthesized by the Bartoli indolization reaction (Scheme 2.3.3). ${ }^{20}$ Treatment of nitroaromatic $\mathbf{6 6}^{21}$ with vinyl Grignard produced the highly functionalized indole 67 directly. Although the yield of this reaction was variable and modest, we were able to prepare $\mathbf{6 7}$ on multigram scale. ${ }^{22}$ Following protection of the indole nitrogen by a 2-(trimethylsilyl)ethoxymethyl (SEM) group $(\mathbf{6 7} \rightarrow \mathbf{6 8}),{ }^{13}$ halogen-metal exchange and trapping with dioxaborolane reagent 69 produced metalloindole 70. ${ }^{23}$ Suzuki coupling of 70 with the known vinyl bromide 71, ${ }^{24}$ smoothly provided olefin 72. ${ }^{25}$ Final conversion of $\mathbf{7 2}$ to the coupling fragment $\mathbf{6 2}$ was accomplished using a sequence involving selective hydrogenation of the terminal olefin, ${ }^{26}$ bromination at the $\mathrm{C}(3)$ position, ${ }^{27}$ and halogen-metal exchange/trapping with the dioxaborolane reagent (69). ${ }^{28}$

Scheme 2.3.3

### 2.3.4 Construction of the Fully Substituted Bis(indole)pyrazinone Core

With the appropriate fragments in hand (62, 63, and 54b), the critical threecomponent coupling reaction sequence was explored. Suzuki coupling of dihalopyrazine 63 and indole 54b proceeded selectively to afford the coupled indolylpyrazine 73 (Scheme 2.3.4). In the second Suzuki coupling of dibromide 73 with boronic ester 62, we were delighted to find that the desired bis(indole)pyrazine 74 formed in good yield and with complete selectivity for coupling of the pyrazinyl bromide in the presence of the indolyl bromide. Precise temperature control was critical for the success of both coupling reactions ( $23{ }^{\circ} \mathrm{C}$ and $50{ }^{\circ} \mathrm{C}$, respectively). Importantly, the selectivity of the second Suzuki reaction depended not only on temperature, but also on the exact identity of each coupling substrate. In fact, varying protective groups on the indole nitrogen in 54a had a dramatic effect on halide reactivity, as competitive coupling of the indolyl bromide occurred when electron-donating $N$-protective groups were employed.

### 2.4 End-Game Studies

### 2.4.1 End-Game Strategy 1

Having established a viable route to the core structure of dragmacidin D (5), we focused our efforts on completing the natural product synthesis. Selective cleavage of the silyl ether in 74, ${ }^{29}$ followed by Dess-Martin oxidation ${ }^{30}$ furnished aldehyde 75, which was further oxidized to its carboxylic acid derivative 76 (Scheme 2.4.1). Conversion of 76 to bromoketone 77 was accomplished by an Arndt-Eistert-type homologation, followed by treatment with aqueous HBr . The extreme sensitivity of the intermediate acid chloride was particularly troublesome and required that the diazomethane used in the reaction sequence be dried thoroughly over both potassium hydroxide and sodium metal immediately before use. ${ }^{31}$ In addition, chemical yields for this homologation varied to a large extent and caused substantial material throughput problems. Nonetheless, with bromide 77 in hand, we explored installation of the aminoimidazole functionality. Reaction of bromide 77 with acetylguanidine in DMF was anticipated to produce aminoimidazole 79 based on model studies. ${ }^{32,33}$ However, the only product observed in
the reaction was acetoxyketone 78, in quantitative yield. Although a variety of guanidine sources, solvents, and temperatures were explored to promote the synthesis of aminoimidazole 79, all of our efforts resulted in the formation of the same undesired product (78).

Scheme 2.4.1

### 2.4.2 End-Game Strategy 2

Through our studies it was observed that nucleophilic displacement of the alkyl bromide in 77 was actually a facile process. Thus, we considered an alternative endgame strategy that would exploit this reactivity (Scheme 2.4.2). Treatment of 77 with
ammonia afforded aminoketone $\mathbf{8 0}$ which, in turn, underwent facile condensation with cyanamide to produce the desired aminoimidazole product $(\mathbf{8 1}){ }^{34}$ At this point, all that remained in order to complete the total synthesis of dragmacidin $D(5)$ was the removal of the four protective groups from 81. Despite several months of experimentation, our efforts to complete the total synthesis of (5) were accompanied by decomposition of the aminoimidazole moiety, which was exceptionally unstable to the basic conditions needed to remove the protective groups that we had strategically chosen (vide supra).

Scheme 2.4.2

### 2.4.3 End-Game Strategy 3: The Total Synthesis of Dragmacidin D

The possibility of installing the aminoimidazole as the last step of the total synthesis, after the full deprotection of a late-stage intermediate, was explored next. In addition, we sought an alternative one-carbon homologation reaction in place of the unreliable Arndt-Eistert sequence. After extensive experimentation, we found that
nitromethane addition ${ }^{35}$ to aldehyde $\mathbf{7 5}$ and subsequent oxidation produced $\mathbf{8 2}$ in high yield (Scheme 2.4.3). ${ }^{36}$ Deoxygenated ethanolic potassium hydroxide facilitated removal of the $N$-tosyl group, ${ }^{37}$ while lithium tetrafluoroborate followed by aqueous sodium hydroxide effected complete hydrolysis of the SEM group (82 $\boldsymbol{\rightarrow 8 3}$ ). Reduction of nitroketone 83 with stannous chloride, ${ }^{38}$ then cleavage of the benzyl and methyl ethers with iodotrimethylsilane, revealed fully deprotected aminoketone $\mathbf{8 4} .{ }^{39}$ Final installation of the aminoimidazolium unit occurred by treatment of $\mathbf{8 4}$ with cyanamide followed by trifluoroacetic acid workup to produce the natural product (5) in $86 \%$ yield. Synthetic dragmacidin D (5) was spectroscopically identical to samples obtained from natural sources (Figure 2.4.1).

Scheme 2.4.3

### 2.4.4 Subtleties of Late-Stage Manipulations

The exact order of final synthetic events presented herein was essential for the completion of dragmacidin D. In particular, intermediates $\mathbf{8 2}$ through $\mathbf{8 4}$ were highly labile when treated under a variety of other conditions. For example, attempts to reduce nitroketone $\mathbf{8 2}$ or to remove the SEM group prior to detosylation resulted in substantial nonspecific decomposition. Likewise, efforts to deprotect $\mathbf{8 3}$ prior to reduction of the nitro group led to decomposition of the nitroketone moiety. Finally, reversing the order of the final two steps (i.e., aminoimidazole formation followed by treatment with TMSI) afforded only a low yield of dragmacidin D (ca. 5\%).

Also noteworthy is the brilliant fluorescent nature of most of the bis(indole) pyrazine/pyrazinone intermediates. By shining longwave UV light from a benchtop UV lamp $(\lambda=365 \mathrm{~nm})$, we were able to monitor and isolate extremely small amounts of compounds in large quantitites of solvent during necessary reversed-phase chromatography (i.e., ca. $1 \mathrm{mg} / 30-50 \mathrm{~mL}$ solvent). Two typical examples that demonstrate the fluorescent behavior of these compounds are shown below (Figure 2.4.2). ${ }^{40}$

Figure 2.4.2

### 2.5 An Asymmetric Route to Dragmacidin D

With the racemic synthesis of dragmacidin $\mathrm{D}(\mathbf{5})$ completed, our attention turned to the development of an asymmetric route to the natural product. It was envisioned that the stereocenter present in 5 could arise from an asymmetric hydrogenation ${ }^{41}$ of 87, a compound prepared readily from $\mathbf{6 8}$ via Fu-modified Stille coupling ${ }^{42}$ with $\mathbf{8 5}^{\mathbf{4 3}}$ followed by saponification (Scheme 2.5.1). Dr. Richmond Sarpong investigated the rutheniumcatalyzed asymmetric reduction of $\mathbf{8 7}$ by varying several reaction parameters including solvent, pressure, temperature, and additive effects (Table 2.5.1). Ultimately, hydrogenation of $\mathbf{8 7}$ in the presence of chiral ruthenium complex $\mathbf{8 9}$ under optimized conditions (78 atm of hydrogen, at $-10{ }^{\circ} \mathrm{C}$ in MeOH ) resulted in the formation of enantioenriched carboxylic acid $\mathbf{8 8}$ in $90 \%$ ee.

Scheme 2.5.1

Table 2.5.1

| catalyst | solvent | temp | additive | $\mathrm{H}_{2}$ pressure | time | conversion | ee |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  <br> 89 | MeOH | $25^{\circ} \mathrm{C}$ | - | 30 atm | 14 h | 100\% | 83\% |
|  | $\begin{gathered} \mathrm{MeOH} / \\ \mathrm{CH}_{2} \mathrm{Cl}_{2}(1: 1) \end{gathered}$ | $25^{\circ} \mathrm{C}$ | - | 30 atm | 14 h | 100\% | 59\% |
|  | $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ | $25^{\circ} \mathrm{C}$ | - | 30 atm | 14 h | 40\% | 0\% |
|  | MeOH | $25^{\circ} \mathrm{C}$ | $\mathrm{Et}_{3} \mathrm{~N}$ (1 equiv) | 30 atm | 14 h | 100\% | 80\% |
|  | MeOH | $5^{\circ} \mathrm{C}$ | $\mathrm{Et}_{3} \mathrm{~N}$ (1 equiv) | 30 atm | 72 h | 100\% | 86\% |
|  | MeOH | $5^{\circ} \mathrm{C}$ |  | 30 atm | 72 h | 100\% | 87\% |
|  | MeOH | $-10^{\circ} \mathrm{C}$ | - | 78 atm | 72 h | 100\% | 90\% |

Carboxylic acid $\mathbf{8 8}$ could be elaborated to nitroketone $\mathbf{8 3}$ without substantial loss in enantiomeric excess (Scheme 2.5.2). However, upon Sn (II)-promoted reduction to aminoketone 84, racemization occurred. Alternative conditions to access enantiopure 84 were explored but were also unsuccessful at promoting reduction without epimerization of the benzylic $\alpha$-keto stereocenter. The enantiopurity of natural dragmacidin $\mathrm{D}(\mathbf{5})$ is also somewhat uncertain. During the first isolation of 5, no optical rotation could be detected. ${ }^{1 a}$ Subsequently, a very small rotation value was reported $\left([\alpha]_{D}+12^{\circ}(c 0.95\right.$, $\mathrm{EtOH})$ ). ${ }^{\text {1b }}$ Nonetheless, an asymmetric total synthesis of dragmacidin D remains an elusive goal.

Scheme 2.5.2

### 2.6 Conclusion

In summary, we have completed the first total synthesis of the important bis(indole) alkaloid dragmacidin D (5). The concise route that we have developed (longest linear sequence of 17 steps from 66) relies on a series of halogen-selective Suzuki couplings and a meticulous late-stage sequence to complete the natural product synthesis.

### 2.7 Experimental Section

### 2.7.1 Materials and Methods

Unless stated otherwise, reactions were performed in flame-dried glassware under a nitrogen or argon atmosphere using dry, deoxygenated solvents. All other commercially obtained reagents were used as received. Solvents were dried by passage through an activated alumina column under argon. Reaction temperatures were controlled by an IKAmag temperature modulator. Thin-layer chromatography (TLC) was performed using E. Merck silica gel 60 F254 precoated plates ( 0.25 mm ) and visualized using a combination of UV, anisaldehyde, ceric ammonium molybdate, and potassium permanganate staining. ICN Silica gel (particle size $0.032-0.063 \mathrm{~mm}$ ) was used for flash chromatography. Disposable Sep-Pak C ${ }_{18}$ Vac Cartridges were purchased from Waters and used for all reversed-phase filtrations. HPLC analysis was performed on a Beckman Gold system using a Rainin $\mathrm{C}_{18}$, Microsorb MV, $5 \mu \mathrm{~m}$, $300 \times 4.6 \mathrm{~mm}$ reversed-phased column in $0.1 \%(w / v)$ TFA with acetonitrile $/ \mathrm{H}_{2} \mathrm{O}$ as eluent and a flow rate of $1.0 \mathrm{ml} / \mathrm{min}$, gradient elution of $1.25 \%$ acetonitrile $/ \mathrm{min}$. Preparatory reversedphase HPLC was performed on a Beckman HPLC with a Waters DeltaPak $25 \times 100 \mathrm{~mm}$, $100 \mathrm{~mm} \mathrm{C} \mathrm{C}_{18}$ column equipped with a guard, $0.1 \%(w / v) \mathrm{TFA}$ with acetonitrile $/ \mathrm{H}_{2} \mathrm{O}$ as eluent, and gradient elution of $0.50 \%$ acetonitrile/min. For all reversed-phase purifications, $\mathrm{H}_{2} \mathrm{O}(18 \mathrm{M} \Omega)$ was obtained from a Millipore MiliQ water purification system and TFA from Halocarbon, Inc. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on either a Varian Mercury 300 (at 300 MHz and 75 MHz , respectively), Varian Mercury 500 (at 500 MHz and 125 MHz , respectively), or on a Varian Mercury 600 ( 600 MHz for proton only) spectrometer and are reported relative to $\mathrm{Me}_{4} \mathrm{Si}(\delta 0.0)$. Data for ${ }^{1} \mathrm{H}$ NMR spectra
are reported as follows: chemical shift ( $\delta \mathrm{ppm}$ ), multiplicity, coupling constant $(\mathrm{Hz})$, and integration. Data for ${ }^{13} \mathrm{C}$ NMR spectra are reported in terms of chemical shift. IR spectra were recorded on a Perkin Elmer Paragon 1000 spectrometer and are reported in frequency of absorption $\left(\mathrm{cm}^{-1}\right)$. UV spectra were measured on a Hewlett-Packard Model 8452A diode array spectrophotometer. High resolution mass spectra were obtained from the UC Irvine Mass Spectral Facility. Chiral HPLC was performed on a Chiralcel AD column ( $4.6 \mathrm{~mm} \times 25 \mathrm{~cm}$ ) obtained from Daicel Chemical Industries, Ltd.

### 2.7.2 Preparative Procedures

Glyoxal chloride 51. To a solution of indole $20(20.0 \mathrm{~g}, 171 \mathrm{mmol})$ in anhydrous $\mathrm{Et}_{2} \mathrm{O}(340 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$, was added oxalyl chloride $(17.3 \mathrm{~mL}, 198 \mathrm{mmol})$ dropwise over 30 min . The reaction mixture was stirred at $0^{\circ} \mathrm{C}$ for 3 h , then allowed to warm to $23^{\circ} \mathrm{C}$ over 1 h . The resulting yellow crystals were collected by filtration, washed with anhydrous $\mathrm{Et}_{2} \mathrm{O}$ ( 100 mL ), and dried under vacuum to yield 51 ( $32.52 \mathrm{~g}, 92 \%$ yield), which was used without further purification.

Aminoamide 52a. Gaseous ammonia was bubbled through a suspension of $\mathbf{5 1}$ ( 12.4 g , 59.7 mmol ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(300 \mathrm{~mL})$ for 10 min . After stirring for 30 min , the solvent was removed under reduced pressure. Addition of $\mathrm{H}_{2} \mathrm{O}(600 \mathrm{~mL})$ was followed by extraction of the resulting heterogeneous mixture with EtOAc ( $2 \times 600 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( 300 mL ), dried over magnesium sulfate, and evaporated under reduced pressure to afford the crude amide $24(9.0 \mathrm{~g}, 80 \%$ yield), which was used without further purification.

To a suspension of $24(500 \mathrm{mg}, 5.32 \mathrm{mmol})$ in $\mathrm{CH}_{3} \mathrm{OH}(7.8 \mathrm{~mL})$ was added hydroxylamine hydrochloride ( $2.0 \mathrm{~g}, 39.9 \mathrm{mmol}$ ) in $\mathrm{H}_{2} \mathrm{O}(3.8 \mathrm{~mL})$ and sodium acetate $(1.64 \mathrm{~g}, 39.9 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}(3.8 \mathrm{~mL})$. The resulting heterogeneous mixture was heated under reflux for 10 h and allowed to cool to $23{ }^{\circ} \mathrm{C}$. The solvent was removed under reduced pressure, and the remaining crude residue was extracted with EtOAc ( $3 \times 20$ $\mathrm{mL})$. The combined organic layers were washed with brine $(20 \mathrm{~mL})$ and dried over sodium sulfate. After removal of solvent under reduced pressure, the crude residue was purified by flash chromatography ( $3: 1 \mathrm{CH}_{2} \mathrm{Cl}_{2} /$ hexanes eluent) to afford oxime 90 (454 $\mathrm{mg}, 86 \%$ yield), which was used without further purification.

To a solution of $90(4.07 \mathrm{~g}, 20 \mathrm{mmol})$ in $\mathrm{CH}_{3} \mathrm{OH}$ in a stainless steel bomb was added $10 \%$ palladium on charcoal $(450 \mathrm{mg})$. The bomb was then purged with hydrogen and pressurized to 450 psi . After stirring for 14 h at $23^{\circ} \mathrm{C}$, the palladium on carbon was removed via filtration, and the solvent was removed under reduced pressure. Passage through a plug of celite $\left(\mathrm{CH}_{3} \mathrm{OH}\right.$ eluent $)$ afforded the desired aminoamide 52a ( 3.5 g , $92 \%$ yield) as a yellow oil: $\mathrm{R}_{f} 0.10$ (5:1 EtOAc: $\left.\mathrm{CH}_{3} \mathrm{OH}\right) ;{ }^{1} \mathrm{H}$ NMR ( 300 MHz , DMSO- $d_{6}$ ) $\delta 10.93(\mathrm{~s}, 1 \mathrm{H}), 7.71(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.43(\mathrm{~s}, 1 \mathrm{H}), 7.33(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.23(\mathrm{~s}$, 1H), 7.07-6.93 (comp. m, 3H), $4.56(\mathrm{~s}, 1 \mathrm{H}), 2.38$ (br s, 2H); ${ }^{13} \mathrm{C}$ NMR ( 75 MHz , DMSO$\left.d_{6}\right) \delta 175.9,136.2,125.7,122.8,120.9,119.5,118.2,116.2,111.3,52.5$; IR (film) 3176 , 1660, $1592 \mathrm{~cm}^{-1}$; HRMS-NH3CI $(\mathrm{m} / z)$ : $[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{3} \mathrm{O}, 190.0980$; found, 190.0978.

Ketoaldehyde 53a. To a suspension of $\mathbf{5 1}(22.0 \mathrm{~g}, 106 \mathrm{mmol})$ in EtOAc (106 mL ) at $0^{\circ} \mathrm{C}$, was added a solution of tributyltin hydride ( $28.5 \mathrm{~mL}, 106 \mathrm{mmol}$ ) in EtOAc $(158 \mathrm{~mL})$. The reaction mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 30 min , warmed to $23^{\circ} \mathrm{C}$, then stirred for an additional 15 h . Hexanes ( 150 mL ) was added, and the resulting yellow powder was collected by filtration. Washing with copious amounts of hexanes (1 L) and drying under vacuum, gave ketoaldehyde 53a (10.6 g, 58\% yield): $\mathrm{R}_{f} 0.76$ (13:7 $\left.\mathrm{CHCl}_{3}: \mathrm{CH}_{3} \mathrm{OH}\right) ;{ }^{1} \mathrm{H}$ NMR ( 300 MHz , acetone- $d_{6}$ ) $\delta 9.54(\mathrm{~s}, 1 \mathrm{H}), 8.65(\mathrm{~s}, 1 \mathrm{H}), 8.36-8.33$ (comp. m, 1H), 7.61-7.58 (comp. m, 1H), 7.33-7.29 (comp. m, 2H); ${ }^{13} \mathrm{C}$ NMR ( 75 MHz , acetone $\left.-d_{6}\right) \delta 192.9,183.2,138.1,125.3,124.6,124.1,123.5,123.1,113.6,113.3$; IR (film) 3117, 1628, 1580, 1518, $1234 \mathrm{~cm}^{-1}$; HRMS-NH3CI $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{10} \mathrm{H}_{8} \mathrm{NO}_{2}, 174.0555$; found, 174.0555.

Pyrazinone 22a. To $\mathrm{H}_{2} \mathrm{O}(17 \mathrm{~mL})$ at $70{ }^{\circ} \mathrm{C}$ was added ketoaldehyde 53a (300 $\mathrm{mg}, 1.73 \mathrm{mmol}$ ) and aminoamide 52a ( $321 \mathrm{mg}, 1.73 \mathrm{mmol}$ ), followed by powdered potassium hydroxide ( $487 \mathrm{mg}, 8.67 \mathrm{mmol}$ ). After stirring at $70^{\circ} \mathrm{C}$ for 5 h , the reaction mixture was allowed to cool to $23^{\circ} \mathrm{C}$, poured into saturated aq. ammonium chloride (75
$\mathrm{mL})$, and extracted with EtOAc (4x75 mL). The combined organic layers were dried briefly over sodium sulfate and concentrated under reduced pressure to afford the desired pyrazinone 22a ( $423 \mathrm{mg}, 75 \%$ yield) as an orange/red solid: $\mathrm{R}_{f} 0.57\left(5: 1 \mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ : $\left.\mathrm{CH}_{3} \mathrm{OH}\right) ;{ }^{1} \mathrm{H}$ NMR (300 MHz, DMSO- $d_{6}$ ) $\delta 12.23(\mathrm{~s}, 1 \mathrm{H}), 11.75(\mathrm{~s}, 1 \mathrm{H}), 11.52(\mathrm{~s}, 1 \mathrm{H})$, $8.75(\mathrm{~s}, 1 \mathrm{H}), 8.69(\mathrm{~d}, J=7.3 \mathrm{~Hz}, 1 \mathrm{H}), 8.11(\mathrm{~d}, J=2.6 \mathrm{~Hz}, 1 \mathrm{H}),, 8.40-7.82(\mathrm{comp} . \mathrm{m}, 2 \mathrm{H})$, 7.51-7.45 (comp. m, 2H), 7.25-7.12 (comp. m, 4H); ${ }^{13} \mathrm{C}$ NMR ( 125 MHz, DMSO- $d_{6}$ ) $\delta$ $155.5,147.2,136.8,136.2,130.1,126.3,125.9,124.1,122.7,122.2,122.0,120.6,120.1$, 119.7, 112.2, 111.9, 111.6, 106.8; IR (film) 3307, 1633, 1602, $1421 \mathrm{~cm}^{-1}$; HRMS-ESI $(m / z):[\mathrm{M}+\mathrm{Na}]^{+}$calc'd for $\mathrm{C}_{20} \mathrm{H}_{15} \mathrm{~N}_{4} \mathrm{ONa}, 349.1065$; found, 349.1070.

Bromopyrazinone 22b. To a solution of bromoindole $49^{17}(3.4 \mathrm{~g}, 17.3 \mathrm{mmol})$ in anhydrous $\mathrm{Et}_{2} \mathrm{O}(35 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ was added oxalyl chloride ( $1.76 \mathrm{~mL}, 20.1 \mathrm{mmol}$ ) dropwise over 30 min . The reaction mixture was stirred at $0^{\circ} \mathrm{C}$ for 3 h , then allowed to warm to $23{ }^{\circ} \mathrm{C}$ over 1 h . The resulting yellow crystals were collected by filtration, washed with anhydrous $\mathrm{Et}_{2} \mathrm{O}(15 \mathrm{~mL})$, and dried under vacuum. To a suspension of these crystals at $0^{\circ} \mathrm{C}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(70 \mathrm{~mL})$ was added $\mathrm{MeOH}(2.2 \mathrm{~mL}, 70 \mathrm{mmol})$. The reaction
mixture was warmed to $23^{\circ} \mathrm{C}$, stirred for 12 h , and then filtered to collect the product. To this crude material in $\mathrm{MeOH}\left(87 \mathrm{~mL}\right.$ ) was added $\mathrm{NaOAc}(8.09 \mathrm{~g}, 98.4 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}$ $(19 \mathrm{~mL})$, followed by $\mathrm{NH}_{2} \mathrm{OH} \cdot \mathrm{HCl}(9.84 \mathrm{~g}, 98.4 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}(19 \mathrm{~mL})$. The mixture was heated to $80{ }^{\circ} \mathrm{C}$ for 24 h then cooled to $23{ }^{\circ} \mathrm{C}$. After removal of solvent under reduced pressure, the aqueous residue was extracted with EtOAc ( $3 \times 50 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( 30 mL ) and evaporated in vacuo. The resulting material was purified by flash chromatography (2:1 EtOAc:hexanes eluent) to afford an off-white solid. To this compound in $\mathrm{MeOH}(84 \mathrm{~mL})$ was added 1 N HCl (84 $\mathrm{mL})$ followed by zinc dust ( $2.75 \mathrm{~g}, 42.1 \mathrm{mmol}$ ). The reaction mixture was stirred for 10 min and filtered (MeOH eluent). The filtrate was evaporated under reduced pressure to afford an off-white solid that was triturated with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, diluted with 1 N NaOH (25 $\mathrm{mL})$, and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \times 50 \mathrm{~mL})$. The combined organic layers were dried over $\mathrm{MgSO}_{4}$ and evaporated. The residue was dissolved in a saturated solution of $\mathrm{NH}_{3}$ in $\mathrm{MeOH}(50 \mathrm{~mL})$ at $23{ }^{\circ} \mathrm{C}$ and stirred for 72 h . After removal of solvents under vacuum and trituration with $\mathrm{Et}_{2} \mathrm{O}$, bromoamide $\mathbf{5 2 b}$ ( $600 \mathrm{mg}, 13 \%$ yield, 5 steps) was obtained as an off-white solid. This product was used immediately in the subsequent reaction. To $\mathrm{H}_{2} \mathrm{O}(1.5 \mathrm{~mL})$ at $100{ }^{\circ} \mathrm{C}$ was added ketoaldehyde 53a ( $26.2 \mathrm{mg}, 0.152 \mathrm{mmol}$ ) and bromoamide 52b ( $40 \mathrm{mg}, 0.152 \mathrm{mmol}$ ), followed by powdered potassium hydroxide ( 43 $\mathrm{mg}, 0.76 \mathrm{mmol})$. After stirring at $100^{\circ} \mathrm{C}$ for 5 h , the reaction mixture was allowed to cool to $23^{\circ} \mathrm{C}$, poured into saturated aq. ammonium chloride ( 10 mL ), and extracted with EtOAc (4 x 10 mL ). The combined organic layers were dried briefly over sodium sulfate and concentrated under reduced pressure to afford known pyrazinone $\mathbf{2 2 b}^{44}$ ( $39 \mathrm{mg}, 64 \%$ yield) as an orange/red solid: $\mathrm{R}_{f} 0.52\left(7: 1 \mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{CH}_{3} \mathrm{OH}\right)$.

Iodopyrazine 63. To a thick-walled flask charged with $\mathbf{6 4}^{15}(100 \mathrm{mg}, 0.49 \mathrm{mmol})$ was added acetonitrile ( 1.0 mL ), $\mathrm{H}_{2} \mathrm{O}(1.5 \mathrm{~mL})$, and $48 \%$ aq. $\mathrm{HI}(1.3 \mathrm{~mL})$. The resulting solution was cooled in an ice bath, and a solution of sodium nitrite ( $600 \mathrm{mg}, 8.7 \mathrm{mmol}$ ) in $\mathrm{H}_{2} \mathrm{O}(1.0 \mathrm{~mL})$ was added in a dropwise fashion. The reaction mixture was sealed, allowed to warm to $23^{\circ} \mathrm{C}$, then stirred at $50^{\circ} \mathrm{C}$ for 30 h . After cooling, the solution was poured into $20 \%$ aq. NaOH and extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 20 \mathrm{~mL})$. The combined organic layers were washed with saturated aq. sodium metabisulfite ( 20 mL ) and brine ( 20 mL ), dried over anhydrous sodium sulfate, then evaporated under reduced pressure. The crude product was then dissolved in a $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ hexanes mixture (1:1) and filtered over silica gel (1:1 $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ :hexanes eluent) to provide iodopyrazine $\mathbf{6 3}(90 \mathrm{mg}, 58 \%$ yield) as a white powder: $\mathrm{R}_{f} 0.52\left(1: 1 \mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ :hexanes); ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.07(\mathrm{~s}, 1 \mathrm{H}), 4.05$ $(\mathrm{s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 158.8,139.2,136.1,104.4,56.2$; IR (KBr) 1357, $1150 \mathrm{~cm}^{-1} ;$ HRMS-NH3 $\mathrm{CI}(\mathrm{m} / \mathrm{z}):[\mathrm{M}]^{+}$calc'd for $\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{BrIN}_{2} \mathrm{O}, 313.8552$; found, 313.8553.

Organomercurial 65. To a solution of $\mathbf{4 9}{ }^{17}(4.35 \mathrm{~g}, 22.2 \mathrm{mmol})$ in toluene ( 22 mL ) was added tetrabutylammonium hydrogensulfate ( $520 \mathrm{mg}, 1.54 \mathrm{mmol}$ ), KOH ( $50 \%$ aq. solution, 28 mL ), and a solution of p-toluenesulfonyl chloride ( $5.08 \mathrm{~g}, 26.6 \mathrm{mmol}$ ) in toluene ( 44 mL ). After stirring for $4 \mathrm{~h}, \mathrm{H}_{2} \mathrm{O}(40 \mathrm{~mL})$ was added and the layers separated. The organic layer was washed with $\mathrm{H}_{2} \mathrm{O}(2 \times 20 \mathrm{~mL})$ and brine ( 20 mL ), dried over
magnesium sulfate, and concentrated under reduced pressure to afford 6-bromo- N tosylindole 91 ( $7.6 \mathrm{~g}, 98 \%$ yield) as an off-white powder: $\mathrm{R}_{f} 0.25$ (9:1 hexanes:EtOAc); ${ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.19(\mathrm{~s}, 1 \mathrm{H}), 7.75(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.53(\mathrm{~d}, J=3.3 \mathrm{~Hz}$, 1H), 7.33 (comp. m, 2H), $7.21(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 2 \mathrm{H}), 6.61(\mathrm{~d}, J=3.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.32(\mathrm{~s}, 3 \mathrm{H})$; ${ }^{13} \mathrm{C}$ NMR (75 MHz, $\mathrm{CDCl}_{3}$ ) $\delta 145.5,135.6,135.1,130.2,129.7,126.9,126.8,122.6$, 118.3, 116.7, 108.9, 21.7; IR (film) $1364,1169 \mathrm{~cm}^{-1} ; \mathrm{HRMS}^{2} \mathrm{NH}_{3} \mathrm{CI}(\mathrm{m} / \mathrm{z}):[\mathrm{M}]^{+}$calc'd for $\mathrm{C}_{15} \mathrm{H}_{12} \mathrm{BrNO}_{2} \mathrm{~S}, 348.9772$; found, 348.9773.

To a solution of 6-bromo- $N$-tosylindole 91 ( $7.6 \mathrm{~g}, 21.7 \mathrm{mmol}$ ) in acetic acid (145 $\mathrm{mL})$ was added mercuric acetate $(6.92 \mathrm{~g}, 21.7 \mathrm{mmol})$. After stirring at $23^{\circ} \mathrm{C}$ for 15 min , perchloric acid ( 5 drops) was added. The mixture was stirred for 24 h , poured into $\mathrm{H}_{2} \mathrm{O}$ ( 200 mL ), then filtered. The resulting white solid was washed with copious amounts of $\mathrm{H}_{2} \mathrm{O}$ and dried under vacuum for 12 h to afford organomercurial derivative $\mathbf{6 5}$ (13.05 g, $99 \%$ yield) as an unstable white powder that was used immediately without further purification: $\mathrm{R}_{f} 0.57$ (2:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( 300 MHz, DMSO- $d_{6}$ ) $\delta 8.02(\mathrm{~d}, J=$ $1.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.76(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.71(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.52(\mathrm{~s}, 1 \mathrm{H}), 7.42-7.39$ (comp. m, 3H), $2.32(\mathrm{~s}, 3 \mathrm{H}), 1.96(\mathrm{~s}, 3 \mathrm{H})$.

Boronic acid 54b. To a solution of $\mathbf{6 5}(3.91 \mathrm{~g}, 6.4 \mathrm{mmol})$ in THF $(128 \mathrm{~mL})$ at 23 ${ }^{\circ} \mathrm{C}$ was added borane ( 1 M in THF, $32 \mathrm{~mL}, 32 \mathrm{mmol}$ ). The resulting solution was stirred for 1 h , then carefully quenched by the dropwise addition of $\mathrm{H}_{2} \mathrm{O}(38 \mathrm{~mL})$. After filtration, the organic solvent was evaporated under reduced pressure, and the residue was
extracted with EtOAc ( $2 \times 60 \mathrm{~mL}$ ). The combined organic layers were washed with brine $(30 \mathrm{~mL})$ and concentrated under reduced pressure. Trituration of the crude product with hexanes ( 4 x ) afforded boronic acid $\mathbf{5 4 b}(2.15 \mathrm{~g}, 85 \%$ yield) as an unstable off-white solid that was used immediately without further purification.

Indole 67. To a solution of $\mathbf{6 6}{ }^{21}(14.0 \mathrm{~g}, 45.5 \mathrm{mmol})$ in THF $(455 \mathrm{~mL})$ at $-40^{\circ} \mathrm{C}$ was added vinylmagnesium bromide ( 1.0 M in $\mathrm{THF}, 159 \mathrm{~mL}, 159 \mathrm{mmol}$ ) in a dropwise fashion. The reaction mixture was stirred at $-40^{\circ} \mathrm{C}$ for 4 h and then poured into a saturated aq. ammonium chloride ( 350 mL ). The reaction mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 200 \mathrm{~mL})$, and the combined organic layers were washed with brine ( 200 mL ), dried over magnesium sulfate, and evaporated under reduced pressure. $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50 \mathrm{~mL})$ was added, and the resulting suspension was filtered over a pad of silica gel topped with celite. Removal of solvent under reduced pressure afforded the crude product as a red oil, which was further purified by flash chromatography ( $8: 1$ hexanes: $\mathrm{Et}_{2} \mathrm{O}$ eluent) to yield 7-benzyloxy-4-bromoindole $67\left(4.54 \mathrm{~g}, 33 \%\right.$ yield) as a yellow oil: $\mathrm{R}_{f} 0.30$ (4:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.46$ (br s, 1H), 7.50-7.40 (comp. m, $5 \mathrm{H}), 7.20(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.16$ (app.t, $J=2.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.61-6.58$ (comp. m, 2H), 5.17 (s, 2H); ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 145.0,136.8,129.7,128.8,128.5,128.1$, 126.9, 124.4, 122.6, 106.1, 104.4, 103.4, 70.6; IR (film) $3426,1228 \mathrm{~cm}^{-1} ; \mathrm{HRMS}_{\mathrm{N}} \mathrm{NH}_{3} \mathrm{CI}$ $(\mathrm{m} / \mathrm{z}):[\mathrm{M}]^{+}$calc'd for $\mathrm{C}_{15} \mathrm{H}_{12} \mathrm{BrNO}, 301.0101$; found, 301.0102.

Indole 68. To a stirred suspension of NaH ( $60 \%$ dispersion in mineral oil, 154 $\mathrm{mg}, 4.0 \mathrm{mmol})$ in THF $(15 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added a solution of $67(930 \mathrm{mg}, 3.08 \mathrm{mmol})$ in THF ( 15 ml ). The reaction mixture was allowed to warm to $23^{\circ} \mathrm{C}$ and stirred for 30 min. The solution was cooled to $0^{\circ} \mathrm{C}, \mathrm{SEMCl}(600 \mu \mathrm{~L}, 3.4 \mathrm{mmol})$ was added, and the mixture was stirred at $23^{\circ} \mathrm{C}$ for 6 h . The reaction mixture was poured into saturated aq. ammonium chloride ( 20 mL ) and extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 30 \mathrm{~mL})$. The combined organic layers were washed with brine ( 20 mL ), dried over magnesium sulfate, and evaporated under reduced pressure. The crude residue was purified by flash chromatography (14:1 hexanes:EtOAc eluent) to afford $\mathbf{6 8}(1.22 \mathrm{~g}, 92 \%$ yield) as a yellow oil: $\mathrm{R}_{f} 0.51$ (4:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.53-7.50$ (comp. $\mathrm{m}, 2 \mathrm{H}), 7.46-7.37$ (comp. m, 3H), $7.21(\mathrm{~d}, J=3.3 \mathrm{~Hz}, 1 \mathrm{H}), 7.18(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.63$ $(\mathrm{d}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.59(\mathrm{~d}, J=3.3 \mathrm{~Hz}, 1 \mathrm{H}), 5.73(\mathrm{~s}, 2 \mathrm{H}), 5.20(\mathrm{~s}, 2 \mathrm{H}), 3.45(\mathrm{t}, J=8.2$ $\mathrm{Hz}, 2 \mathrm{H}), 0.84(\mathrm{t}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}),-0.06(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 146.3$, $136.8,131.6,129.8,128.8,128.3,127.8,126.2,123.0,106.4,105.7,103.6,77.7,70.8$, 65.5, 17.9, -1.2; IR (film) 1244, $1054 \mathrm{~cm}^{-1} ; \mathrm{HRMS}^{2} \mathrm{NH}_{3} \mathrm{CI}(\mathrm{m} / \mathrm{z}):[\mathrm{M}]^{+}$calc'd for $\mathrm{C}_{21} \mathrm{H}_{26} \mathrm{BrNO}_{2} \mathrm{Si}, 431.0916$; found, 431.0919 .

Boronic ester 70. To a solution of $\mathbf{6 8}(3.81 \mathrm{~g}, 8.8 \mathrm{mmol})$ in THF $(147 \mathrm{~mL})$ at -78 ${ }^{\circ} \mathrm{C}$ was added $t-\mathrm{BuLi}$ ( 1.7 M in pentane, $11.4 \mathrm{~mL}, 19.4 \mathrm{mmol}$ ). Following addition, the reaction mixture was stirred for 15 min at $-78^{\circ} \mathrm{C}$, then borolane $69(3.6 \mathrm{~mL}, 17.6 \mathrm{mmol})$ was added. The mixture was stirred at $-78{ }^{\circ} \mathrm{C}$ for 1.5 h , allowed to warm to $23^{\circ} \mathrm{C}$, then quenched with saturated aq. ammonium chloride ( 75 mL ). The layers were separated, and the aqueous portion was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 75 \mathrm{~mL})$. The combined organic layers were washed with brine ( 100 mL ), briefly dried over magnesium sulfate, and evaporated under reduced pressure. The crude residue was purified by flash chromatography (14:1 hexanes:EtOAc eluent) to give boronic ester 70 ( $3.11 \mathrm{~g}, 74 \%$ yield) as a yellow oil: $\mathrm{R}_{f} 0.32$ (9:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.67$ $(\mathrm{d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.59-7.56($ comp. $\mathrm{m}, 2 \mathrm{H}), 7.48-7.39$ (comp. m, 3H), $7.25(\mathrm{~d}, J=3.3$ $\mathrm{Hz}, 1 \mathrm{H}), 7.12(\mathrm{~d}, J=3.3 \mathrm{~Hz}, 1 \mathrm{H}), 6.83(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 5.81(\mathrm{~s}, 2 \mathrm{H}), 5.28(\mathrm{~s}, 2 \mathrm{H})$, $3.49(\mathrm{t}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 1.44(\mathrm{~s}, 12 \mathrm{H}), 0.87(\mathrm{t}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}),-0.02(\mathrm{~s}, 9 \mathrm{H}),{ }^{13} \mathrm{C}$ NMR (75 MHz, $\mathrm{CDCl}_{3}$ ) $\delta 149.3,137.0,136.5,129.9,129.7,128.7,128.1,127.8,125.2,105.1$, $104.2,83.2,77.5,70.3,65.2,25.1,17.9,-1.3$; IR (film) $1371,1330,1251 \mathrm{~cm}^{-1}$; HRMS$\mathrm{NH}_{3} \mathrm{CI}(\mathrm{m} / z)$ : $[\mathrm{M}]^{+}$calc'd for $\mathrm{C}_{27} \mathrm{H}_{38} \mathrm{BNO}_{4} \mathrm{Si}, 479.2668$; found, 479.2673.

Olefin 72. A solution containing boronic ester $70(3.17 \mathrm{~g}, 6.62 \mathrm{mmol})$ and bromide $71(3.32 \mathrm{~g}, 13.2 \mathrm{mmol})$ in benzene $(130 \mathrm{~mL}), \mathrm{CH}_{3} \mathrm{OH}(30 \mathrm{~mL})$, and aq. sodium carbonate ( $2 \mathrm{M}, 11 \mathrm{~mL}$ ) was deoxygenated by bubbling a stream of argon through the reaction mixture for 5 min . Tetrakis(triphenylphosphine)palladium(0) (1.15 g, 0.99 mmol ) was then added and the flask was equipped with a reflux condenser. The mixture was heated to $80^{\circ} \mathrm{C}$ for 2 h and allowed to cool to $23^{\circ} \mathrm{C}$. To the reaction vessel was added sodium sulfate ( 10 g ), which was allowed to stand for 30 min . After filtration over a pad of silica gel $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ eluent) and concentrating to dryness under reduced pressure, the resulting residue was purified by flash chromatography $\left(1: 1 \mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ :hexanes eluent $)$ to provide olefin $72\left(2.87 \mathrm{~g}, 83 \%\right.$ yield) as a yellow oil: $\mathrm{R}_{f} 0.53$ ( $9: 1$ hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.55-7.53$ (comp. m, 2H), 7.46-7.37 (comp. m, 3H), 7.18 (d, J $=3.3 \mathrm{~Hz}, 1 \mathrm{H}), 6.94(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.74(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.67(\mathrm{~d}, J=3.3 \mathrm{~Hz}$, $1 \mathrm{H}), 5.78(\mathrm{~s}, 2 \mathrm{H}), 5.62(\mathrm{~m}, 1 \mathrm{H}), 5.40(\mathrm{~m}, 1 \mathrm{H}), 5.24(\mathrm{~s}, 2 \mathrm{H}), 4.55(\mathrm{~s}, 2 \mathrm{H}), 3.48(\mathrm{t}, J=8.2$ $\mathrm{Hz}, 2 \mathrm{H}), 0.99(\mathrm{~s}, 9 \mathrm{H}), 0.85(\mathrm{t}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 0.15(\mathrm{~s}, 6 \mathrm{H}),-0.06(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (75 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 146.9,146.3,137.2,130.0,129.3,128.8,128.2,127.8,126.3,126.0$, $118.9,111.9,104.2,103.0,77.6,70.6,65.6,65.4,26.2,18.7,18.0,-1.2,-5.1$; IR (film) 1250, $1088 \mathrm{~cm}^{-1}$; HRMS-ESI $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{30} \mathrm{H}_{46} \mathrm{NO}_{3} \mathrm{Si}_{2}, 524.3016$; found, 524.3019.

Boronic ester 62. To a solution of olefin $72(545 \mathrm{mg}, 1.04 \mathrm{mmol})$ in benzene ( 12 mL ), saturated with hydrogen, was added palladium black ( $35 \mathrm{mg}, 0.33 \mathrm{mmol}$ ). The reaction vessel was purged with hydrogen and kept under a hydrogen atmosphere (1 atm) with vigorous stirring for 1 h . Palladium black was removed via filtration through a pad of silica gel (benzene eluent) to afford the reduced silyl ether $\mathbf{9 2}$ ( $542 \mathrm{mg}, 99 \%$ yield) as a yellow oil: $\mathrm{R}_{f} 0.53$ ( $9: 1$ hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ 7.53-7.50 (comp. m, 2H), 7.43-7.34 (comp. m, 3H), $7.16(\mathrm{~d}, J=3.3 \mathrm{~Hz}, 1 \mathrm{H}), 6.86(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.71$ $(\mathrm{d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.60(\mathrm{~d}, J=3.3 \mathrm{~Hz}, 1 \mathrm{H}), 5.75(\mathrm{~s}, 2 \mathrm{H}), 5.20(\mathrm{~s}, 2 \mathrm{H}), 3.87(\mathrm{dd}, J=9.9$, $4.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.62($ app.t, $J=9.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.45(\mathrm{t}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 3.30(\mathrm{~m}, 1 \mathrm{H}), 1.40(\mathrm{~d}$, $J=6.6 \mathrm{~Hz}, 3 \mathrm{H}), 0.89(\mathrm{~s}, 9 \mathrm{H}), 0.82(\mathrm{t}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 0.00(\mathrm{~s}, 6 \mathrm{H}),-0.09(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 145.3,137.3,130.7,129.5,128.8,128.7,128.1,127.8,125.7$, $117.3,104.4,101.7,77.6,70.6,69.0,65.4,39.1,26.3,18.7,18.0,17.5,-1.1,-4.99,-5.04 ;$ IR (film) 1249, $1076 \mathrm{~cm}^{-1}$; HRMS-ESI $(\mathrm{m} / \mathrm{z})$ : $[\mathrm{M}+\mathrm{Na}]^{+}$calc'd for $\mathrm{C}_{30} \mathrm{H}_{47} \mathrm{NO}_{3} \mathrm{Si}_{2} \mathrm{Na}$, 548.2992; found, 548.2997.

To a solution of the crude silyl ether $92(270 \mathrm{mg}, 0.51 \mathrm{mmol})$ in THF ( 5 mL ) was added N -bromosuccinimide $(92.2 \mathrm{mg}, 0.51 \mathrm{mmol})$. After stirring for 5 min , the reaction mixture was poured into a saturated aq. solution of sodium metabisulfite ( 3 ml ), extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 2 \mathrm{~mL})$, and dried by passage through a plug of silica gel $\left(\mathrm{Et}_{2} \mathrm{O}\right.$ eluent $)$. After concentrating to dryness under reduced pressure, the crude residue was purified by
flash chromatography (1:1 $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ :hexanes eluent) to furnish the 3-bromoindole derivative 93 ( $285 \mathrm{mg}, 92 \%$ yield) as a yellow oil: $\mathrm{R}_{f} 0.47$ (1:1 $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ :hexanes); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.57-7.54$ (comp. m, 2H), 7.49-7.40 (comp. m, 3 H ), 7.24 (s, $1 \mathrm{H}), 7.02(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.80(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 5.77(\mathrm{~d}, J=9.9 \mathrm{~Hz}, 1 \mathrm{H}), 5.73(\mathrm{~d}$, $J=10.4 \mathrm{~Hz}, 1 \mathrm{H}), 5.23(\mathrm{~s}, 2 \mathrm{H}), 4.36(\mathrm{~m}, 1 \mathrm{H}), 4.02(\mathrm{dd}, J=9.6,4.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.65(\mathrm{dd}, J=$ $9.3,8.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.50(\mathrm{t}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 1.46(\mathrm{~d}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}), 0.96(\mathrm{~s}, 9 \mathrm{H}), 0.89(\mathrm{t}, J$ $=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 0.08(\mathrm{~s}, 3 \mathrm{H}), 0.06(\mathrm{~s}, 3 \mathrm{H}), 0.00(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C} \mathrm{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $145.0,136.9,130.1,129.6,128.7,128.2,127.8,126.1,125.9,118.7,105.2,90.1,77.7$, $70.7,69.3,65.6,34.7,26.2,18.6,18.0,-1.1,-5.0,-5.1$; IR (film) $1250 \mathrm{~cm}^{-1}$; HRMS-ESI $(m / z):[\mathrm{M}+\mathrm{Na}]^{+}$calc'd for $\mathrm{C}_{30} \mathrm{H}_{46} \mathrm{BrNO}_{3} \mathrm{Si}_{2} \mathrm{Na}, 626.2097$; found, 626.2079.

To a solution of the 3-bromoindole derivative $\mathbf{9 3}$ ( $2.5 \mathrm{~g}, 4.1 \mathrm{mmol}$ ) in THF (69 mL ) at $-78{ }^{\circ} \mathrm{C}$ was added $t$ - $\mathrm{BuLi}(1.7 \mathrm{M}$ in pentane, $5.4 \mathrm{~mL}, 9.1 \mathrm{mmol})$. The reaction mixture was stirred for 15 min at $-78{ }^{\circ} \mathrm{C}$ and borolane $69(1.69 \mathrm{~mL}, 8.3 \mathrm{mmol})$ was added. The mixture was stirred at $-78^{\circ} \mathrm{C}$ for 1 h , quenched with saturated aq. ammonium chloride ( 20 mL ), and allowed to warm to $23{ }^{\circ} \mathrm{C}$. The layers were separated, and the aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 50 \mathrm{~mL})$. The combined organic layers were washed with brine ( 75 mL ), briefly dried over magnesium sulfate, and concentrated in vacuo. The crude residue was purified by flash chromatography ( $14: 1$ hexanes:EtOAc eluent) to afford boronic ester $\mathbf{6 2}(1.96 \mathrm{~g}, 73 \%$ yield) as an unstable colorless oil that was used immediately in the coupling reaction that follows: $\mathrm{R}_{f} 0.38$ (9:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR (300 MHz, $\mathrm{C}_{6} \mathrm{D}_{6}$ ) $\delta 7.79(\mathrm{~s}, 1 \mathrm{H}), 7.35(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.20-7.05$ (comp. m, $5 \mathrm{H}), 6.65(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 5.50(\mathrm{~d}, J=10.6 \mathrm{~Hz}, 1 \mathrm{H}), 5.46(\mathrm{~d}, J=10.3 \mathrm{~Hz}, 1 \mathrm{H}), 4.86$ $(\mathrm{s}, 2 \mathrm{H}), 4.70(\mathrm{~m}, 1 \mathrm{H}), 4.09(\mathrm{dd}, J=9.5,4.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.91(\mathrm{dd}, J=9.5,7.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.28$
$(\mathrm{t}, J=7.7 \mathrm{~Hz}, 2 \mathrm{H}), 1.62(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}), 1.21(\mathrm{~s}, 6 \mathrm{H}), 1.19(\mathrm{~s}, 6 \mathrm{H}), 0.98(\mathrm{~s}, 9 \mathrm{H}), 0.64$ $(\mathrm{t}, J=7.7 \mathrm{~Hz}, 2 \mathrm{H}), 0.00(\mathrm{~s}, 3 \mathrm{H}),-0.01(\mathrm{~s}, 3 \mathrm{H}),-0.19(\mathrm{~s}, 9 \mathrm{H})$.

Indolylpyrazine 73. A solution containing iodopyrazine $63(133 \mathrm{mg}, 0.42 \mathrm{mmol})$ and boronic acid 54b ( $200 \mathrm{mg}, 0.51 \mathrm{mmol}$ ) in benzene ( 10 mL ), $\mathrm{CH}_{3} \mathrm{OH}(2 \mathrm{~mL})$, and aq. sodium carbonate ( $2 \mathrm{M}, 0.70 \mathrm{~mL}$ ) was deoxygenated by bubbling a stream of argon through the reaction mixture for 5 min . Tetrakis(triphenylphosphine)palladium(0) (73 $\mathrm{mg}, 0.06 \mathrm{mmol}$ ) was then added, the flask was evacuated, and purged with $\mathrm{N}_{2}$. The reaction mixture was stirred at $23^{\circ} \mathrm{C}$ for 72 h and quenched by addition of sodium sulfate ( 500 mg$).$ Filtration over a pad of silica gel $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ eluent) and concentration to dryness under reduced pressure, followed by trituration of the remaining residue with $\mathrm{Et}_{2} \mathrm{O}$ (3x) and further purification by flash chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ eluent) afforded indolylpyrazine $\mathbf{7 3}$ ( $161 \mathrm{mg}, 71 \%$ yield) as an off-white powder: $\mathrm{R}_{f} 0.13$ (3:1 hexanes: $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) ;{ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.52(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 8.45(\mathrm{~s}, 1 \mathrm{H}), 8.33(\mathrm{~s}$, $1 \mathrm{H}), 8.18(\mathrm{~d}, J=2.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.81(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.43(\mathrm{dd}, J=8.5,2.2 \mathrm{~Hz}, 1 \mathrm{H})$, $7.27(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 2 \mathrm{H}), 4.19(\mathrm{~s}, 3 \mathrm{H}), 2.36(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 156.5$, $145.9,137.6,137.0,135.8,135.1,132.7,130.4,129.3,128.2,127.6,127.2,125.2,119.3$, 116.5, 116.1, 55.2, 21.8; IR (film) $1374,1165 \mathrm{~cm}^{-1} ; \operatorname{HRMS}-E S I(\mathrm{~m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{20} \mathrm{H}_{16} \mathrm{Br}_{2} \mathrm{~N}_{3} \mathrm{O}_{3} \mathrm{~S}, 535.9279$; found, 535.9272 .

Bis(indole) 74. In a Schlenk flask, a solution containing dibromide 73 ( 82 mg , $0.15 \mathrm{mmol})$ and boronic ester $62(129 \mathrm{mg}, 0.20 \mathrm{mmol})$ in benzene $(4 \mathrm{~mL}), \mathrm{CH}_{3} \mathrm{OH}(0.80$ mL ), and aq. sodium carbonate ( $2 \mathrm{M}, 0.25 \mathrm{~mL}$ ) was deoxygenated by bubbling a stream of argon through the reaction mixture for 5 min. Tetrakis(triphenylphosphine)palladium(0) ( $27 \mathrm{mg}, 0.02 \mathrm{mmol}$ ) was then added, and the flask was evacuated, purged with $\mathrm{N}_{2}$, and sealed. The reaction mixture was heated to 50 ${ }^{\circ} \mathrm{C}$ for 72 h , cooled to $23^{\circ} \mathrm{C}$, then quenched by addition of sodium sulfate ( 300 mg ). Following filtration through a pad of silica gel $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ eluent $)$ and evaporation to dryness in vacuo, the remaining residue was purified by flash chromatography (2:1 $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ :hexanes eluent) to give a crude product, which was further purified by flash chromatography (7:1 hexanes:EtOAc eluent) to afford bis(indole) 74 ( $122 \mathrm{mg}, 82 \%$ yield) as a yellow oil: $\mathrm{R}_{f} 0.2$ ( $9: 1$ hexanes:EtOAc); ${ }^{1} \mathrm{H} N \mathrm{NRR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.71$ (d, $J=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 8.52(\mathrm{~s}, 1 \mathrm{H}), 8.50(\mathrm{~s}, 1 \mathrm{H}), 8.27(\mathrm{~d}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.86(\mathrm{~d}, J=8.4 \mathrm{~Hz}$, 2H), 7.56-7.38 (comp. m, 7H), $7.28(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.03(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.85(\mathrm{~d}$, $J=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 5.84(\mathrm{~s}, 2 \mathrm{H}), 5.25(\mathrm{~s}, 2 \mathrm{H}), 4.25(\mathrm{~s}, 3 \mathrm{H}), 4.07(\mathrm{~m}, 1 \mathrm{H}), 3.62(\mathrm{dd}, J=9.2$, $4.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.55(\mathrm{t}, J=8.1,2 \mathrm{H}), 3.35($ app.t, $J=9.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.37(\mathrm{~s}, 3 \mathrm{H}), 1.33(\mathrm{~d}, J=$ $7.0 \mathrm{~Hz}, 3 \mathrm{H}), 0.89(\mathrm{t}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 0.69(\mathrm{~s}, 9 \mathrm{H}),-0.04(\mathrm{~s}, 9 \mathrm{H}),-0.16(\mathrm{~s}, 3 \mathrm{H}),-0.28(\mathrm{~s}$, $3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (125 MHz, $\mathrm{CDCl}_{3}$ ) $\delta$ 156.1, 145.7, 145.6, 145.4, 137.2, 135.8, 135.6, $135.5,135.1,131.3,130.9,130.3,128.8,128.7,128.3,127.8,127.7,127.3,127.1,127.0$,

Aldehyde 75. To a Falcon tube containing a THF ( 5 mL ) solution of bis(indole) $74(70 \mathrm{mg}, 0.07 \mathrm{mmol})$ at $0{ }^{\circ} \mathrm{C}$ was added $\mathrm{HF} \bullet$ pyridine $(800 \mu \mathrm{~L})$ in a dropwise fashion. The reaction mixture was stirred at $0^{\circ} \mathrm{C}$ for 1.5 h until the reaction was judged complete by TLC. After dilution of the mixture with $\mathrm{Et}_{2} \mathrm{O}(10 \mathrm{~mL})$, saturated aq. sodium bicarbonate ( 10 mL ) was added in a dropwise manner at $0^{\circ} \mathrm{C}$. The layers were separated, and the organic portion was further washed with saturated aq. sodium bicarbonate ( $3 \times 10$ mL ), dried over magnesium sulfate, and concentrated under reduced pressure.

The crude residue prepared above was dissolved in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$, and Dess-Martin periodinane ( $91 \mathrm{mg}, 0.214 \mathrm{mmol}$ ) was introduced. The reaction mixture was stirred at $23{ }^{\circ} \mathrm{C}$ for 20 min , poured into a saturated aq. solution of sodium bicarbonate/sodium thiosulfate $(1: 1,5 \mathrm{~mL})$, and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 10 \mathrm{~mL})$. The organic layers were washed with brine ( 5 mL ), dried over magnesium sulfate, and evaporated under reduced pressure to provide the crude product, which was purified by flash chromatography (2:1 hexanes:EtOAc) to furnish aldehyde 75 ( $53 \mathrm{mg}, 86 \%$ yield) as a yellow oil: $\mathrm{R}_{f} 0.67$ (2:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 9.73(\mathrm{~s}, 1 \mathrm{H})$, $8.69(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H}), 8.52(\mathrm{~s}, 1 \mathrm{H}), 8.46(\mathrm{~s}, 1 \mathrm{H}), 8.24(\mathrm{~d}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.86(\mathrm{~d}, J=$
$8.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.56-7.39$ (comp. m, 7H), $7.30(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 2 \mathrm{H}), 6.89(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H})$, $6.83(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H}), 5.85(\mathrm{~s}, 2 \mathrm{H}), 5.27(\mathrm{~s}, 2 \mathrm{H}), 4.76(\mathrm{q}, J=6.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.18(\mathrm{~s}, 3 \mathrm{H})$, $3.55(\mathrm{t}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 2.39(\mathrm{~s}, 3 \mathrm{H}), 1.37(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}), 0.89(\mathrm{t}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H})$, 0.05 (s, 9H); ${ }^{13} \mathrm{C}$ NMR (125 MHz, $\mathrm{CDCl}_{3}$ ) $\delta 201.9,156.1,146.4,145.7,144.8,136.8$, $136.2,135.8,135.6,135.0,131.8,130.4,129.1,128.9,128.6,128.5,128.0,127.9,127.5$, 127.4, 127.2, 125.4, 124.3, 121.0, 119.1, 116.9, 116.5, 115.2, 105.9, 78.2, 70.9, 66.0, 54.3, 48.5, 21.8, 18.0, 15.0, -1.2; IR (film) 1720, 1374, 1177, $1086 \mathrm{~cm}^{-1}$; HRMS-ESI $(m / z):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{44} \mathrm{H}_{46} \mathrm{BrN}_{4} \mathrm{O}_{6} \mathrm{SSi}$, 865.2090; found, 865.2103.

Acid 76. A solution of aldehyde $75(53 \mathrm{mg}, 0.061 \mathrm{mmol})$ in acetone $(12 \mathrm{~mL})$ was treated with a saturated solution of $\mathrm{NaH}_{2} \mathrm{PO}_{4}$ that had been acidified to pH 2 with 1 N $\mathrm{HCl}(1.4 \mathrm{~mL})$ and cooled to $0^{\circ} \mathrm{C}$. After the addition of 2-methyl-2-butene ( $32.5 \mu \mathrm{~L}, 0.31$ mmol), a solution of $\mathrm{NaClO}_{2}(13.9 \mathrm{mg}, 0.123 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}(1.4 \mathrm{~mL})$ was added dropwise over 5 min . The reaction mixture was poured into cold $\mathrm{H}_{2} \mathrm{O}(2 \mathrm{~mL})$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 5 \mathrm{~mL})$. The combined organic layers were dried over magnesium sulfate and evaporated to dryness. The crude residue was passed through a short plug of silica gel (EtOAc eluent), and the solvent was evaporated to afford acid 76 (49 mg, 89\% yield): $\mathrm{R}_{f} 0.22$ (2:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.68$ (d, $J=8.3 \mathrm{~Hz}, 1 \mathrm{H}), 8.52(\mathrm{~s}, 1 \mathrm{H}), 8.44(\mathrm{~s}, 1 \mathrm{H}), 8.23(\mathrm{~d}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.85(\mathrm{~d}, J=8.3 \mathrm{~Hz}$, $2 \mathrm{H}), 7.53-7.37($ comp. m, 7 H$), 7.28(\mathrm{~d}, J=9.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.08(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H}), 6.84(\mathrm{~d}$,
$J=8.3 \mathrm{~Hz}, 1 \mathrm{H}), 5.84(\mathrm{~d}, J=10.3 \mathrm{~Hz}, 1 \mathrm{H}), 5.78(\mathrm{~d}, J=10.3 \mathrm{~Hz}, 1 \mathrm{H}), 5.24(\mathrm{~s}, 2 \mathrm{H}), 4.86$ $(\mathrm{q}, J=6.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.20(\mathrm{~s}, 3 \mathrm{H}), 3.53(\mathrm{t}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 2.36(\mathrm{~s}, 3 \mathrm{H}), 1.42(\mathrm{~d}, J=6.8$ $\mathrm{Hz}, 3 \mathrm{H}), 0.86(\mathrm{t}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}),-0.07(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (125 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta 178.2$, $156.2,146.2,145.7,145.0,136.9,136.2,135.8,135.7,135.1,131.7,130.4,129.1,128.9$, 128.6, 128.5, 128.4, 127.9, 127.5, 127.3, 127.2, 126.3, 125.4, 119.8, 119.1, 116.9, 116.5, $114.9,105.8,78.1,70.9,66.0,54.5,40.6,21.8,18.4,18.0,-1.2$; IR (film) 2948, 1703, 1373, 1177, 1139, $1088 \mathrm{~cm}^{-1}$; HRMS-ESI $(m / z):\left[\mathrm{M}+\mathrm{Na}^{+}\right.$calc'd for $\mathrm{C}_{44} \mathrm{H}_{45} \mathrm{BrN}_{4} \mathrm{O}_{7} \mathrm{SSiNa}$, 881.2040; found, 881.2009.

Bromoketone 77. To a solution of $76(49 \mathrm{mg}, 0.0559 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(400 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ was added oxalyl chloride ( $6.3 \mu \mathrm{~L}, 0.0727 \mathrm{mmol}$ ), followed by DMF ( 2 drops ). After stirring at $0{ }^{\circ} \mathrm{C}$ for 30 min , all solvents were removed in vacuo. The crude acid chloride 94 was allowed to dry under vacuum for an additional 1 h and was used in the next step without further purification.

Note: In the next step, diazomethane was dried by storing the ethereal diazomethane solution over potassium hydroxide pellets. Immediately before use, the diazomethane was further dried over sodium metal for approximately 15 minutes.

To crude 94 in THF $(400 \mu \mathrm{~L})$ at $0{ }^{\circ} \mathrm{C}$ was added an ethereal solution of thoroughly dried diazomethane ( 1.5 mL ) via a flamed glass pipette. The reaction mixture was allowed to warm to $23^{\circ} \mathrm{C}$, poured into saturated aq. sodium bicarbonate ( 1 mL ), and extracted with $\mathrm{Et}_{2} \mathrm{O}$ ( $3 \times 3 \mathrm{~mL}$ ). The combined organic layers were dried over magnesium sulfate and evaporated under reduced pressure. The crude residue was purified by flash chromatography (4:1 hexanes:EtOAc eluent) to give diazoketone 95 $(29.5 \mathrm{mg}, 58 \%$ yield) as a yellow oil.

To $95(19 \mathrm{mg}, 0.021 \mathrm{mmol})$ in THF $(2 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}, 48 \%$ aq. $\mathrm{HBr}(3$ drops) was added slowly down the walls of the flask. After stirring for 5 min , the reaction mixture was poured into a saturated aq. solution of sodium bicarbonate and extracted with $\mathrm{Et}_{2} \mathrm{O}$ (3 x 4 mL ). The combined organic layers were dried over magnesium sulfate and evaporated under reduced pressure to afford bromoketone $77(20 \mathrm{mg}, 99 \%$ yield) as a yellow oil: $\mathrm{R}_{f} 0.68$ (2:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.69(\mathrm{~d}, J=8.6$ $\mathrm{Hz}, 1 \mathrm{H}), 8.53(\mathrm{~s}, 1 \mathrm{H}), 8.47(\mathrm{~s}, 1 \mathrm{H}), 8.24(\mathrm{~d}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.87(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H})$, 7.55-7.38 (comp. m, 7H), 7.31 (d, $J=8.2 \mathrm{~Hz}, \mathrm{~d}), 6.85(\mathrm{~d}, 2 \mathrm{H}), 5.83(\mathrm{~s}, 2 \mathrm{H}), 5.25(\mathrm{~s}, 2 \mathrm{H})$, $5.01(\mathrm{q}, J=6.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.21(\mathrm{~s}, 3 \mathrm{H}), 3.76(\mathrm{~d}, J=12.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.67(\mathrm{~d}, J=13.1 \mathrm{~Hz}$, $1 \mathrm{H}), 3.55(\mathrm{t}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 2.39(\mathrm{~s}, 3 \mathrm{H}), 1.48(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 3 \mathrm{H}), 0.88(\mathrm{t}, J=8.1 \mathrm{~Hz}$, 2H), -0.052 (s, 9H); ${ }^{13} \mathrm{C}$ NMR (125 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta 156.3,146.5,145.8,144.8,136.7$, $136.5,135.8,135.7,135.1,140.0,130.4,129.2,128.9,128.6,128.5,128.0,127.7,127.5$,

77

78

Acetoxyketone 78. To a solution of $77(10 \mathrm{mg}, 0.0104 \mathrm{mmol})$ in DMF $(350 \mu \mathrm{~L})$ was added acetylguanidine ( $32 \mathrm{mg}, 0.316 \mathrm{mmol}$ ). After stirring at $23^{\circ} \mathrm{C}$ for $48 \mathrm{~h}, \mathrm{H}_{2} \mathrm{O}(1$ $\mathrm{mL})$ and EtOAc ( 1 mL ) were added. The layers were separated, and the organic layer was washed with $\mathrm{H}_{2} \mathrm{O}(3 \times 500 \mu \mathrm{~L})$ and brine $(500 \mu \mathrm{~L})$, then dried by passage through a plug of silica gel, and evaporated to afford acetoxyketone 78 ( $9.5 \mathrm{mg}, 95 \%$ yield): $\mathrm{R}_{f} 0.53$ (2:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.69(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.54$ (d, $J$ $=0.9 \mathrm{~Hz}, 1 \mathrm{H}), 8.46(\mathrm{~d}, J=1.2 \mathrm{~Hz}, 1 \mathrm{H}), 8.24(\mathrm{~s}, 1 \mathrm{H}), 7.87(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.55-7.39$ (comp. m, 7H), $7.31(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 6.86(\mathrm{~s}, 2 \mathrm{H}), 5.83(\mathrm{~s}, 2 \mathrm{H}), 5.25(\mathrm{~s}, 2 \mathrm{H}), 4.83(\mathrm{q}$, $J=6.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.47(\mathrm{~s}, 2 \mathrm{H}), 4.21(\mathrm{~s}, 3 \mathrm{H}), 3.54(\mathrm{t}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 2.39(\mathrm{~s}, 3 \mathrm{H}), 2.01(\mathrm{~s}$, $3 \mathrm{H}), 1.42(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 3 \mathrm{H}), 0.88(\mathrm{t}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}),-0.05(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (125 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 204.5,170.3,156.3,146.4,145.8,144.9,136.8,136.5,135.9,135.6$, $135.1,131.9,130.4,129.2,128.9,128.6,128.5,128.0,127.6,127.5,127.3,127.2,125.7$, $125.4,120.6,119.1,116.9,116.5,114.9,106.0,78.2,71.0,67.2,66.1,54.3,45.6,21.9$, $20.6,18.1,17.3,-1.2$; IR (film) $2949,1750,1728,1373,1244,1178,1141,1088 \mathrm{~cm}^{-1}$; HRMS-ESI $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{47} \mathrm{H}_{50} \mathrm{BrN}_{4} \mathrm{O}_{8} \mathrm{SSi}$, 937.2302; found, 937.2290.

Aminoketone 80. Bromoketone $77(6 \mathrm{mg}, 0.0062 \mathrm{mmol})$ was dissolved in a saturated solution of ammonia in $\mathrm{CH}_{3} \mathrm{OH}(1 \mathrm{~mL})$. After stirring for 6 h at $23^{\circ} \mathrm{C}$, the reaction mixture was filtered through a plug of silica gel $\left(\mathrm{CH}_{3} \mathrm{OH}\right.$ eluent $)$, and the solvent was evaporated. The crude residue was then purified by preparative thin layer chromatography ( $7: 1 \mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{CH}_{3} \mathrm{OH}$ ) to afford aminoketone $\mathbf{8 0}\left(4 \mathrm{mg}, 72 \%\right.$ yield): $\mathrm{R}_{f}$ 0.67 (7:1 $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{CH}_{3} \mathrm{OH}\right) ;{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.19(\mathrm{~d}, 8.8,1 \mathrm{H}), 8.53(\mathrm{~s}, 1 \mathrm{H})$, $8.46(\mathrm{~s}, 1 \mathrm{H}), 8.23(\mathrm{~s}, 1 \mathrm{H}), 7.85(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.54-7.37($ comp. $\mathrm{m}, 7 \mathrm{H}), 7.29(\mathrm{~d}, J=$ $8.4 \mathrm{~Hz}, 2 \mathrm{H}), 6.84-6.83(\mathrm{comp} . \mathrm{m}, 2 \mathrm{H}), 5.82(\mathrm{~s}, 2 \mathrm{H}), 5.24(\mathrm{~s}, 2 \mathrm{H}), 4.71(\mathrm{q}, J=6.6 \mathrm{~Hz}$, $1 \mathrm{H}), 4.19(\mathrm{~s}, 3 \mathrm{H}), 3.54(\mathrm{t}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 3.31(\mathrm{~d}, J=19.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.07(\mathrm{~d}, J=19.1$ $\mathrm{Hz}, 1 \mathrm{H}), 2.38(\mathrm{~s}, 3 \mathrm{H}), 1.44(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 3 \mathrm{H}), 0.87(\mathrm{t}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}),-0.06(\mathrm{~s}, 9 \mathrm{H})$.

Aminoimidazole 81. To a solution of aminoketone $\mathbf{8 0}(7 \mathrm{mg}, 0.0078 \mathrm{mmol})$ in ethanol ( $700 \mu \mathrm{~L}$ ) was added cyanamide ( $15 \mathrm{mg}, 0.36 \mathrm{mmol}$ ). The reaction vessel was sealed and heated to $70{ }^{\circ} \mathrm{C}$ for 10 h . After cooling to $23{ }^{\circ} \mathrm{C}$, the reaction mixture was
purified by reversed-phase filtration through a Sep-Pak column: first $10 \%$ acetonitrile, then $100 \%$ acetonitrile to collect the product. After removal of solvent under reduced pressure, $\mathbf{8 1}$ ( $6 \mathrm{mg}, 84 \%$ yield) was isolated as an orange/red oil: $\mathrm{R}_{f} 0.27$ (7:1 $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{CH}_{3} \mathrm{OH}\right) ;{ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}\right) \delta 8.68(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}), 8.52(\mathrm{~s}, 1 \mathrm{H})$, $8.38(\mathrm{~s}, 1 \mathrm{H}), 8.16(\mathrm{~d}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.87(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 7.60-7.33(\mathrm{comp} . \mathrm{m}, 9 \mathrm{H})$, $6.95(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.90(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.10(\mathrm{~s}, 1 \mathrm{H}), 5.85(\mathrm{~s}, 2 \mathrm{H}), 5.28(\mathrm{~s}, 2 \mathrm{H})$, $5.09(\mathrm{q}, J=6.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.19(\mathrm{~s}, 3 \mathrm{H}), 3.57(\mathrm{t}, J=7.9 \mathrm{~Hz}, 2 \mathrm{H}), 2.37(\mathrm{~s}, 3 \mathrm{H}), 1.41(\mathrm{~d}, J=$ $7.0 \mathrm{~Hz}, 3 \mathrm{H}), 0.82(\mathrm{t}, J=7.9 \mathrm{~Hz}, 2 \mathrm{H}),-0.10(\mathrm{~s}, 9 \mathrm{H}) ; \operatorname{HRMS}-\mathrm{ESI}(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{46} \mathrm{H}_{49} \mathrm{BrN}_{7} \mathrm{O}_{5} \mathrm{SSi}$, 918.2468; found, 918.2467.

Ketone 82. To aldehyde 75 ( $20 \mathrm{mg}, 0.023 \mathrm{mmol}$ ) in nitromethane ( 1 mL ) was added triethylamine ( $75 \mu \mathrm{~L}, 0.54 \mathrm{mmol}$ ). The reaction mixture was stirred at $23^{\circ} \mathrm{C}$ for 15 h . The excess nitromethane was removed by evaporation under reduced pressure to afford the crude nitroaldol product, which was used without further purification.

The crude residue was dissolved in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.5 \mathrm{~mL})$ and treated with Dess-Martin periodinane ( $15 \%$ solution in $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 200 \mu \mathrm{~L}, 0.099 \mathrm{mmol}$ ). The reaction mixture was stirred at $23^{\circ} \mathrm{C}$ for 5 min and quenched by addition of saturated aq. sodium bicarbonate/sodium thiosulfate $(1: 1,2 \mathrm{~mL})$. The layers were separated, and the aqueous layer was extracted with EtOAc ( $8 \times 1 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( 2 mL ), dried by passage through a plug of silica gel (EtOAc eluent), and
evaporated under reduced pressure to afford ketone $\mathbf{8 2}(21 \mathrm{mg}, 98 \%$ yield) as a yellow oil: $\mathrm{R}_{f} 0.20$ (3:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.62(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H})$, $8.44(\mathrm{~s}, 1 \mathrm{H}), 8.39(\mathrm{~s}, 1 \mathrm{H}), 8.18(\mathrm{~s}, 1 \mathrm{H}), 7.80(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.49-7.33$ (comp. m, $7 \mathrm{H}), 7.24(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 6.83(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H}), 6.81(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 5.77(\mathrm{~s}$, $2 \mathrm{H}), 5.21(\mathrm{~s}, 2 \mathrm{H}), 5.03(\mathrm{~d}, J=14.6 \mathrm{~Hz}, 1 \mathrm{H}), 4.98(\mathrm{~d}, J=14.6 \mathrm{~Hz}, 1 \mathrm{H}), 4.90(\mathrm{q}, J=6.8$ $\mathrm{Hz}, 1 \mathrm{H}), 4.14(\mathrm{~s}, 3 \mathrm{H}), 3.49(\mathrm{t}, J=7.8 \mathrm{~Hz}, 2 \mathrm{H}), 2.32(\mathrm{~s}, 3 \mathrm{H}), 1.44(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H})$, $0.82(\mathrm{t}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}),-0.12(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 197.0,156.3$, $146.9,145.8,144.3,136.9,136.5,135.8,135.6,135.0,132.3,130.4,129.3,129.0,128.6$, $128.5,128.0,127.6,127.5,127.4,127.2,125.4,123.7,121.0,119.2,116.7,116.5,114.6$, $106.2,82.2,78.3,71.0,66.2,54.4,47.6,21.8,18.0,16.9,-1.2$; IR (film) 1732, 1559, 1376, 1178, $1080 \mathrm{~cm}^{-1}$. HRMS-FAB $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{45} \mathrm{H}_{47} \mathrm{BrN}_{5} \mathrm{O}_{8} \mathrm{SiSBr}$, 926.2077; found, 926.2080.

Nitroketone 83. To a suspension of ketone $\mathbf{8 2}$ ( $30 \mathrm{mg}, 0.032 \mathrm{mmol}$ ) in EtOH (2 mL , deoxygenated by sparging with argon for 2 min ) was added powdered KOH (100 $\mathrm{mg}, 1.8 \mathrm{mmol})$. The reaction vessel was equipped with a reflux condenser and heated to $40^{\circ} \mathrm{C}$ for 2 h . After cooling to $23^{\circ} \mathrm{C}$, the reaction mixture was quenched with saturated aq. ammonium chloride ( 2 mL ) and extracted with $\operatorname{EtOAc}(8 \times 1 \mathrm{~mL})$. The combined organic layers were washed with brine $(2 \mathrm{~mL})$, dried by passage through a plug of silica
gel (EtOAc eluent), and evaporated under reduced pressure to afford the crude detosylated ketone, which was used without further purification.

To the crude detosylated ketone prepared above in acetonitrile ( 3 mL , deoxygenated by sparging with argon for 2 min ) and water ( $30 \mu \mathrm{~L}$ ) was added lithium tetrafluoroborate ( $120 \mathrm{mg}, 0.13 \mathrm{mmol}$ ). The reaction vessel was equipped with a reflux condenser and heated to $70^{\circ} \mathrm{C}$ for 1.5 h . After cooling to $40^{\circ} \mathrm{C}$, sodium hydroxide ( $20 \%$ aq., 2 mL ) was added. The resulting mixture was stirred for 10 min , allowed to cool to $23{ }^{\circ} \mathrm{C}$, quenched with saturated aq. ammonium chloride ( 2 mL ), and extracted with EtOAc ( $8 \times 1 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( 2 mL ), dried by passage through a plug of silica gel (EtOAc eluent), and evaporated under reduced pressure to afford nitroketone $\mathbf{8 3}$ ( $20.5 \mathrm{mg}, 99 \%$ yield) as a yellow oil: $\mathrm{R}_{f} 0.59$ (1:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , acetone- $d_{6}$ ) $\delta 11.14(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 10.86(\mathrm{br} \mathrm{s}, 1 \mathrm{H})$, $8.82(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}), 8.54(\mathrm{~s}, 1 \mathrm{H}), 8.43(\mathrm{~m}, 1 \mathrm{H}), 7.75-7.72(\mathrm{comp} . \mathrm{m}, 2 \mathrm{H}), 7.62-7.59$ (comp. m, 2H), 7.47-7.30 (comp. m, 4H), $6.95(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.85(\mathrm{~d}, J=8.1 \mathrm{~Hz}$, $1 \mathrm{H}), 5.41-5.22$ (comp. m, 5H), 4.19 (s, 3H), 1.47 (d, $J=7.0 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (125 MHz , acetone $\left.-d_{6}\right) \delta 198.7,156.2,146.3,143.6,139.4,138.6,138.3,136.1,130.7,129.4$, 129.4, 128.9, 128.8, 128.3, 126.9, 126.8, 125.8, 124.9, 124.2, 120.5, 116.3, 116.0, 115.3, $112.5,105.1,83.4,70.9,54.1,47.7,17.3$; IR (film) 3410 (br), 1728, 1697, 1557, 1450 $\mathrm{cm}^{-1}$; HRMS-ESI $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{32} \mathrm{H}_{27} \mathrm{BrN}_{5} \mathrm{O}_{5}, 640.1196$; found, 640.1180.

Aminoketone 84. To a solution of deprotected ketone 83 ( $5.5 \mathrm{mg}, 0.0086 \mathrm{mmol}$ ) in EtOAc ( $600 \mu \mathrm{~L}$, deoxygenated by bubbling with argon for 1 min ), was added $\mathrm{SnCl}_{2} \bullet 2$ $\mathrm{H}_{2} \mathrm{O}(30 \mathrm{mg}, 0.13 \mathrm{mmol})$. The reaction vessel was equipped with a reflux condenser and heated at $80^{\circ} \mathrm{C}$ for 3 h . After cooling to $23^{\circ} \mathrm{C}$, the solvent was removed under reduced pressure to leave an orange residue, which was purified by reversed-phase filtration through a Sep-Pak column: first $10 \%$ acetonitrile containing $0.1 \%(w / v)$ TFA to remove salts, then $90 \%$ acetonitrile containing $0.1 \%(w / v)$ TFA to collect the crude product. After removal of solvent in vacuo, the compound was filtered through silica gel (5:1 $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{CH}_{3} \mathrm{OH}$ eluent) to provide the reduced compound, which was used without further purification.

To the crude aminoketone in acetonitrile $(700 \mu \mathrm{~L})$ at $0^{\circ} \mathrm{C}$, in a Schlenk tube, was added iodotrimethylsilane $(150 \mu \mathrm{~L}, 1.05 \mathrm{mmol})$. The reaction mixture was heated at 50 ${ }^{\circ} \mathrm{C}$ for 2 h , cooled to $0^{\circ} \mathrm{C}$, then quenched with saturated aq. sodium metabisulfite. The reaction mixture was purified by reversed-phase filtration through a Sep-Pak column: first $10 \%$ acetonitrile containing $0.1 \%(w / v)$ TFA to remove salts, then $90 \%$ acetonitrile containing $0.1 \%(w / v)$ TFA to collect the crude product. After removal of solvent under reduced pressure, the compound was further purified by reversed-phase HPLC. Concentration under reduced pressure provided the fully deprotected aminoketone $\mathbf{8 4}$ ( $3.5 \mathrm{mg}, 80 \%$ yield) as an orange/red oil: ${ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}\right) \delta 8.75(\mathrm{~s}, 1 \mathrm{H})$, $8.60(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.67(\mathrm{~s}, 1 \mathrm{H}), 7.62(\mathrm{~d}, J=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.54(\mathrm{~s}, 1 \mathrm{H}), 7.27(\mathrm{dd}, J$
$=8.5,1.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.69(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.63(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.15(\mathrm{q}, J=6.9$ $\mathrm{Hz}, 1 \mathrm{H}), 3.64(\mathrm{~d}, J=1.7 \mathrm{~Hz}, 2 \mathrm{H}), 1.44(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 125 MHz , $\left.\mathrm{CD}_{3} \mathrm{OD}\right) \delta 204.4,157.4,151.0,145.3,139.1,132.6,131.7,129.0,128.3,127.7,126.7$, 126.1, 125.6, 124.9, 122.6, 121.0, 117.1, 115.5, 113.7, 108.5, 107.9, 46.8, 17.2; IR (film) 3140 (br), 1671, 1200, $1140 \mathrm{~cm}^{-1}$; HRMS-ESI ( $\mathrm{m} / \mathrm{z}$ ) calc'd for $\mathrm{C}_{24} \mathrm{H}_{21} \mathrm{BrN}_{5} \mathrm{O}_{3}, 506.0828$; found, 506.0827.

Dragmacidin D (5). To a solution of aminoketone 84 ( $2 \mathrm{mg}, 0.0039 \mathrm{mmol}$ ) in ethanol ( $700 \mu \mathrm{~L}$, deoxygenated by bubbling with argon for 5 min ) was added cyanamide $(15 \mathrm{mg}, 0.36 \mathrm{mmol})$. The reaction vessel was purged with argon, sealed, and heated to 70 ${ }^{\circ} \mathrm{C}$ for 3 h . After cooling to $23^{\circ} \mathrm{C}$, the reaction mixture was purified by reversed-phase filtration through a Sep-Pak column: first $10 \%$ acetonitrile containing $0.1 \%(w / v)$ TFA to remove salts, then $60 \%$ acetonitrile containing $0.1 \%(w / v)$ TFA to collect the product. After removal of solvent under reduced pressure, dragmacidin $\mathrm{D}(\mathbf{5}, 1.8 \mathrm{mg}, 86 \%$ yield) was isolated as an orange/red oil: ${ }^{1} \mathrm{H}$ NMR $\left(600 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}\right) \delta 8.74(\mathrm{~s}, 1 \mathrm{H}), 8.6(\mathrm{~d}, J=$ $8.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.62(\mathrm{~d}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.49(\mathrm{~s}, 1 \mathrm{H}), 7.46(\mathrm{~s}, 1 \mathrm{H}), 7.27(\mathrm{dd}, J=8.2,1.8$ $\mathrm{Hz}, 1 \mathrm{H}), 6.84(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.64(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 5.98(\mathrm{~s}, 1 \mathrm{H}), 4.35(\mathrm{q}, J=6.9$ $\mathrm{Hz}, 1 \mathrm{H}), 1.52(\mathrm{~d}, J=7.3 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $1645 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}$ ) $\delta 157.1,150.3$, 148.7, $144.8,139.1,134.2,132.4,132.2,128.7,127.9,127.3,126.7,126.3,125.6,124.8,120.2$,
117.1, 115.4, 113.7, 110.2, 108.9, 107.3, 33.2, 20.8; IR (film) 3200 (br), 1667, 1204, $1138 \mathrm{~cm}^{-1} ; \mathrm{UV} \lambda_{\max }(\mathrm{EtOH}) 216,274,389 \mathrm{~nm}$. After addition of 1 drop concentrated HCl to 1 mL cell: $\lambda_{\text {max }}(\mathrm{EtOH}) 219,277,460 \mathrm{~nm}$; HRMS-ESI $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{25} \mathrm{H}_{21} \mathrm{BrN}_{7} \mathrm{O}_{2}, 530.0940$; found, 530.0943.

Ester 86. To 68 ( $50 \mathrm{mg}, 0.116 \mathrm{mmol}$ ) in a flame-dried Schlenk flask was added tris(dibenzylideneacetone)dipalladium(0) ( $1.5 \mathrm{mg}, 0.0017 \mathrm{mmol}$ ), stannane $85(52 \mu \mathrm{~L}$, 0.15 mmol ), dry cesium fluoride ( $46 \mathrm{mg}, 0.302 \mathrm{mmol}$ ), and benzene $(1.3 \mathrm{~mL})$, followed by tri- $t$-butylphosphine $(0.78 \mathrm{mg}, 0.0038 \mathrm{mmol})$ under an $\mathrm{N}_{2}$ atmosphere in a dry box. The sealed reaction vessel was then heated at $60^{\circ} \mathrm{C}$ for 14 h . The reaction mixture was cooled to $23^{\circ} \mathrm{C}$ and filtered through a plug of silica gel (EtOAc eluent). After removal of solvent under reduced pressure, the crude product was purified by flash chromatography (4:1 hexanes:EtOAc) to afford $\mathbf{8 6}\left(42.6 \mathrm{mg}, 71 \%\right.$ yield) as a yellow oil: $\mathrm{R}_{f} 0.64$ (4:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.54-7.35$ (comp. m, 5 H ), 7.16 (d, $J=$ $3.3 \mathrm{~Hz}, 1 \mathrm{H}), 7.00(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.76(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.48(\mathrm{~d}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H})$, $6.41(\mathrm{~d}, J=2.9 \mathrm{~Hz}, 1 \mathrm{H}), 5.93(\mathrm{~d}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 5.75(\mathrm{~s}, 2 \mathrm{H}), 5.23(\mathrm{~s}, 2 \mathrm{H}), 3.80(\mathrm{~s}, 3 \mathrm{H})$, $3.46(\mathrm{t}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 0.83(\mathrm{t}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}),-0.08(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 75 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 168.2,146.9,140.3,137.0,130.2,129.6,128.8,128.2,127.8,127.3,125.6$, 122.9, 121.3, 104.2, 102.4, 77.6, 70.6, 52.4, 18.0, -1.1; IR (film) 2951, 1724, 1502, 1290,

1258, 1175, $1073 \mathrm{~cm}^{-1}$; HRMS-ESI $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{25} \mathrm{H}_{32} \mathrm{NO}_{4} \mathrm{Si}, 460.1920$; found, 460.1913.

Acid 87. To a solution of $\mathbf{8 6}(970 \mathrm{mg}, 1.88 \mathrm{mmol})$ in THF ( 10 mL ) and $\mathrm{H}_{2} \mathrm{O}(2$ mL ) was added lithium hydroxide monohydrate ( $394 \mathrm{mg}, 9.40 \mathrm{mmol}$ ). The resulting solution was heated under reflux to $80^{\circ} \mathrm{C}$ for 24 h , then allowed to cool to $23^{\circ} \mathrm{C}$. The reaction mixture was diluted with $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 10 \mathrm{~mL})$. The organic layer was discarded, and the aqueous layer was acidified to $\mathrm{pH}=2$ by the dropwise addition of 6 N HCl at $0^{\circ} \mathrm{C}$. After extracting the aqueous layer with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (3 x 20 mL ), the combined organic layers were washed with $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL})$ and brine (10 mL ), dried over magnesium sulfate, and evaporated under reduced pressure to yield $\mathbf{8 7}$ ( $919 \mathrm{mg}, 97 \%$ yield) as a yellow oil, which was used in the subsequent step without further purification.

To 87 ( $578 \mathrm{mg}, 1.15 \mathrm{mmol}$ ) in a thick-walled glass container under $\mathrm{N}_{2}$ in a dry box was added dichloro[(S)-(-)-2,2]-bis(diphenylphosphino)-1,1]-binaphthyl]ruthenium
(II) $(\mathbf{8 9}, 46 \mathrm{mg}, 0.0576 \mathrm{mmol})$ and $\mathrm{CH}_{3} \mathrm{OH}(11.5 \mathrm{~mL})$. The reaction vessel was sealed under nitrogen, removed from the dry box, and placed in a stainless steel bomb, which was purged with argon. After removing the seal of the reaction vessel, the bomb was sealed under an argon atmosphere, cooled to $-10^{\circ} \mathrm{C}$ over 1 h , then purged and pressurized with $\mathrm{H}_{2}$ to 1200 psi with vigorous stirring. The $\mathrm{H}_{2}$ pressure was carefully released after 72 h of stirring, and the reaction vessel was warmed to $23{ }^{\circ} \mathrm{C}$. After filtering the reaction mixture through a plug of celite $\left(\mathrm{CH}_{3} \mathrm{OH}\right.$ eluent $)$, the solvent was evaporated under reduced pressure to yield $\mathbf{8 8}\left(550 \mathrm{mg}, 95 \%\right.$ yield, $90 \% \mathrm{ee}^{*}$ ) as a yellow oil: $\mathrm{R}_{f} 0.63$ ( $1: 1$ hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.17(\mathrm{~d}, J=3.3 \mathrm{~Hz}, 1 \mathrm{H})$, $6.98(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.73(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.61(\mathrm{~d}, J=3.3 \mathrm{~Hz}, 1 \mathrm{H}), 5.76(\mathrm{~d}, J=$ $10.6 \mathrm{~Hz}, 1 \mathrm{H}), 5.72(\mathrm{~d}, J=10.3 \mathrm{~Hz}, 1 \mathrm{H}), 5.19(\mathrm{~s}, 2 \mathrm{H}), 4.08(\mathrm{q}, J=7.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.45(\mathrm{t}, J$ $=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 1.60(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 3 \mathrm{H}), 0.82(\mathrm{t}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}),-0.09(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 180.6,146.3,137.2,130.3,129.4,128.8,128.2,127.8,125.9,124.9$, 118.7, 104.6, 101.6, 77.6, 70.6, 65.5, 42.4, 18.0, 17.5, -1.2; IR (film) 2952, 1707, 1503, 1251, $1072 \mathrm{~cm}^{-1}$; HRMS-ESI $(m / z):[\mathrm{M}+\mathrm{Na}]^{+}$calc'd for $\mathrm{C}_{24} \mathrm{H}_{31} \mathrm{NO}_{4} \mathrm{SiNa}, 448.190$; found, 448.1918.
*The enantiopurity of 88 was determined by derivatization to methyl ester 97 via treatment with diazomethane as described below, followed by chiral HPLC analysis:

Ester 96. To a sample of $\mathbf{8 8}(2 \mathrm{mg}, 0.004 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{~mL})$ was added ethereal diazomethane ( 0.2 M , ca. 1 mL ) until a bright green/yellow color persisted. The solvent was removed under reduced pressure to afford ester $96(2 \mathrm{mg}, 99 \%$ yield) as a yellow oil. Chiral HPLC was performed on a Chiralcel AD column using $2 \%$ $i-\mathrm{PrOH}$ in hexanes as eluent.

The enantiopurity of $\mathbf{8 3}$ was determined by chiral HPLC performed on a Chiralcel AD column using $20 \% \mathrm{EtOH}$ in hexanes as eluent. The enantiopurity of $\mathbf{8 4}$ was determined by chiral HPLC performed on a Chiralcel AD column using $60 \% \mathrm{EtOH}$ in hexanes as eluent.

## CHAPTER THREE

## The Total Synthesis of (+)- and (-)-Dragmacidin $\mathbf{F}^{\dagger}$

### 3.1 Background

### 3.1.1 Introduction

Having developed a strategy to construct the bis(indole)pyrazinone core of dragmacidin D (5, Chapter 2), we set out to extend the scope of our halogen-selective Suzuki coupling methodology to the synthesis of related natural products. We hypothesized that our approach could be amenable to the preparation of the antiviral agent dragmacidin F , ${ }^{1}$ which is perhaps the most daunting target of the dragmacidin natural products (Figure 3.1.1). ${ }^{2}$

Figure 3.1.1

The antiviral agent dragmacidin F (7) possesses a variety of structural features that make it an attractive target for total synthesis. These synthetic challenges include the differentially substituted pyrazinone, the bridged [3.3.1] bicyclic ring system, which is

[^1]fused to both the trisubstituted pyrrole and aminoimidazole heterocycles, and the installation and maintenance of the 6-bromoindole fragment.

### 3.1.2 Retrosynthetic Analysis of Dragmacidin F

Our retrosynthetic analysis for dragmacidin F (7) is shown in Scheme 3.1.1. On the basis of our experience with dragmacidin D (5), we reasoned that the aminoimidazole moiety would best be incorporated at a late stage in the synthesis. The carbon skeleton of the natural product would then arise via a series of halogen-selective Suzuki crosscoupling reactions $(97+63+54 b)$. Pyrazine 63 and indolylboronic acid 54b were both readily accessible, while pyrroloboronic ester 97 perhaps could be derived from pyrrolefused bicycle 98, our key retrosynthetic intermediate. We then targeted bicycle 98 from two related directions: a $\mathrm{Pd}(0)$-mediated intramolecular Heck reaction ${ }^{3}$ of bromopyrrole 99 and a $\mathrm{Pd}(\mathrm{II})$-promoted oxidative carbocyclization ${ }^{4}$ involving des-bromopyrrole 100. The successful implementation of the latter method was particularly attractive since it is closely aligned with our interest in $\mathrm{Pd}(\mathrm{II})$-catalyzed dehydrogenation reactions. ${ }^{5}$ Both of the cyclization substrates ( 99 and 100) could be prepared from commercially available (-)-quinic acid (101). ${ }^{6}$ At the time of this synthetic effort, the absolute stereochemistry of natural dragmacidin F (7) was not known; thus, the absolute stereochemistry of our target (7) was chosen arbitrarily.

Scheme 3.1.1

### 3.2 The Total Synthesis of (+)-Dragmacidin F

### 3.2.1 Synthesis of Cyclization Substrates

Our synthesis of dragmacidin $F$ (7) began with a known two-step protocol involving lactonization and silylation of (-)-quinic acid (101) to afford bicyclic lactone $\mathbf{1 0 2}$ (Scheme 3.2.2). ${ }^{7}$ Subsequent oxidation and Wittig olefination of $\mathbf{1 0 2}$ produced exomethylene lactone $\mathbf{1 0 3}$ in good yield. Initially, we envisioned the direct conversion of lactone 103 to unsaturated carboxylic acid 104 by executing a homogeneous $\operatorname{Pd}(0)$ catalyzed $\pi$-allyl hydride addition reaction. ${ }^{8}$ Despite considerable experimentation, however, exposure of lactone $\mathbf{1 0 3}$ to a variety of Pd and hydride sources under standard conditions ${ }^{8}$ led to the formation of complex product mixtures. As a result, a more
stepwise approach was tried. Methanolysis of lactone $\mathbf{1 0 3}$ followed by acetylation of the resulting $2^{\circ}$ alcohol $^{9}$ gave rise to allylic acetate $\mathbf{1 0 5}$, another potential substrate for $\pi$-allyl reduction chemistry. Although $\mathbf{1 0 5}$ did react under most literature protocols, undesired exocyclic olefin 107 was typically the major product observed. After substantial optimization, we were able to access 106 as the major product by employing stoichiometric $\operatorname{Pd}\left(\mathrm{P}(t-\mathrm{Bu})_{3}\right)_{2}{ }^{10}$ in the presence of triethylsilane as a reductant. Further refinements designed to facilitate catalysis led to a reduced Pd loading ( $30 \mathrm{~mol} \%$ ) when $N$-methylmorpholine- $N$-oxide (NMO) was used as an additive. ${ }^{11}$ Under these conditions, cyclohexene 106 was obtained in $89 \%$ yield as a single olefin regioisomer. Unfortunately, this transformation often gave inconsistent results and was particularly sensitive to oxygen, water, and the quality of $\mathrm{Et}_{3} \mathrm{SiH}$. These difficulties coupled with the high catalyst loading resulted in substantial material throughput problems. We therefore sought yet another method to prepare cyclohexene $\mathbf{1 0 6}$ or a closely related derivative thereof (i.e., 104) in a more facile and preparative manner.

Scheme 3.2.2

In our revised plan, we conceived a two-step route to obtain carboxylic acid $\mathbf{1 0 4}$ via diastereoselective reduction of olefin $\mathbf{1 0 3}$ followed by base-promoted elimination of the carboxylate functionality of $\mathbf{1 0 8}$ (Scheme 3.2.3). Daniel Caspi attempted the first part of this sequence by exposing olefin $\mathbf{1 0 3}$ to standard catalytic hydrogenation conditions $\left(\mathrm{Pd} / \mathrm{C}, 1 \mathrm{~atm} \mathrm{H}_{2}\right)$. Surprisingly, these conditions led to the production of a compound that was more polar than we expected for simple olefin hydrogenation (i.e., 108). To our delight, the product was identified as unsaturated carboxylic acid 104. Under our optimized reaction conditions ( $0.5 \mathrm{~mol} \% \mathrm{Pd} / \mathrm{C}, 1 \mathrm{~atm} \mathrm{H}_{2}, \mathrm{MeOH}, 0{ }^{\circ} \mathrm{C}$ ), essentially quantitative reductive isomerization to $\mathbf{1 0 4}$ was observed. Although the mechanism of
this transformation has not been studied extensively, simple control experiments suggest that stepwise reduction/elimination ${ }^{12}$ or $\pi$-allyl reduction processes are not operative. ${ }^{13}$

Scheme 3.2.3

With facile access to cyclohexene carboxylic acid 104, preparation of the key cyclization precursors proceeded without difficulty. Activation of acid $\mathbf{1 0 4}$ with CDI followed by the addition of $\mathrm{HN}(\mathrm{OMe}) \mathrm{Me} \cdot \mathrm{HCl}$ afforded Weinreb amide $\mathbf{1 0 9}$ (Scheme 3.2.4). The Weinreb amide functionality was then displaced with the appropriate lithiopyrrole ${ }^{14}$ reagent to produce Heck cyclization substrate $\mathbf{9 9}^{15}$ and oxidative cyclization substrate 100.

Scheme 3.2.4

### 3.2.2 Constructing the [3.3.1] Bicycle

Extensive studies were carried out in order to achieve the intramolecular Heck cyclization of bromopyrrole 99. Attempts to utilize standard procedures were unsuccessful, ${ }^{3}$ likely due to the thermal instability of the bromopyrrole moiety. However, implementation of the room-temperature conditions developed by $\mathrm{Fu}^{16}$ provided the desired [3.3.1] bicyclic product (98), albeit in low yield (Scheme 3.2.5). Unfortunately, the formation of $\mathbf{9 8}$ was hampered by competitive production of [3.2.2] bicycle $\mathbf{1 1 0}$. Although efforts to optimize temperature, solvent, base, and concentration were not met with success, it was found that increased quantities of Pd improved the ratio of the desired [3.3.1] bicycle (98) to the undesired [3.2.2] bicycle (110). In addition, the ratio of $\mathbf{9 8}$ to $\mathbf{1 1 0}$ decreased over time, ${ }^{17}$ suggesting that the active catalytic species varied during the course of the reaction or that selectivity changed as the concentration of $\mathrm{R}_{3} \mathrm{NH}^{+} \mathrm{Br}^{-}$ increased.

Scheme 3.2.5

Although the Heck reaction was useful for preparing reasonable quantities of bicycle 98, an alternative and potentially more selective route to 98 was desired. In conjunction with ongoing research in our group, ${ }^{5}$ we turned to the $\mathrm{Pd}(\mathrm{II})$-mediated $\mathrm{C}-\mathrm{C}$ bond forming approach. In this scenario, $\mathrm{C}(3)$-unsubstituted pyrrole $\mathbf{1 0 0}$ would undergo
intramolecular carbocyclization to afford 98 (Scheme 3.2.6). Initial experimentation revealed that pyridine and ethyl nicotinate were not effective ligands for promoting cyclization in the presence of $\operatorname{Pd}(\mathrm{OAc})_{2}{ }^{5 \mathrm{c}, \mathrm{d}}$ However, Daniel Caspi found that by using DMSO as a ligand ${ }^{18}$ the desired cyclization product could be obtained in modest yield. Subsequent optimization of solvent, temperature, and reaction time led to a set of improved conditions whereby the desired pyrrole-fused bicycle $\mathbf{9 8}$ was formed as a single stereo- and regioisomer in $74 \%$ yield. Interestingly, these conditions take advantage of a similar solvent mixture employed in Pd cyclization methodology from our laboratory. ${ }^{5 c, d}$ This transformation $(\mathbf{1 0 0} \rightarrow \mathbf{9 8})$ is particularly noteworthy since it results in functionalization of the electronically deactivated and sterically congested $\mathrm{C}(3)$ position of acyl pyrrole 100. ${ }^{19,20}$ Despite our best efforts, we were unable to effect catalytic turnover of Pd with a stoichiometric oxidant in this reaction, presumably due to extensive oxidative decomposition of both the starting material and the desired product. ${ }^{21}$ Nonetheless, the Pd(II)-mediated strategy provided bicycle $\mathbf{9 8}$ in nearly twice the isolated yield as the Heck route using equivalent amounts of Pd and obviated the need for polybrominated pyrroles. ${ }^{15,22}$

Scheme 3.2.6

### 3.2.3 Assembling the Carbon Skeleton of Dragmacidin F

With the [3.3.1] bicyclic framework in hand (i.e., 98), we focused our attention on constructing the full carbon skeleton of dragmacidin F (112, Scheme 3.2.7). The final stereocenter present in the natural product was installed via catalytic hydrogenation of olefin 108 and was followed by methylation of the $3^{\circ}$ alcohol to produce bis(ether) 111. The methyl protecting group was selected initially for its robustness ${ }^{9}$ and would presumably allow for the exploration of late-stage chemistry in the form of a model system. ${ }^{23}$ Methyl ether 111 was then elaborated via regioselective bromination of the pyrrole and metalation to boronic ester 97. In the critical halogen-selective Suzuki fragment coupling, pyrroloboronic ester $\mathbf{9 7}$ was reacted with dibromide $\mathbf{7 3}$ (prepared from $63+\mathbf{5 4 b}$ ) under $\operatorname{Pd}(0)$ catalysis. By analogy to our dragmacidin $D$ studies, we were pleased to find that at $50^{\circ} \mathrm{C}$, the desired $\mathrm{C}-\mathrm{C}$ bond forming reaction took place to afford the fully coupled product (112) in $77 \%$ yield. Importantly, the indolylbromide moiety was maintained under these reaction conditions.

## Scheme 3.2.7

### 3.2.4 End-Game Studies

With the carbon framework completed, few tasks remained in order to finish the total synthesis of dragmacidin F (7), namely, removal of all protecting groups and installation of the aminoimidazole unit. Of particular note is the similarity of these synthetic challenges to those encountered in our total synthesis of dragmacidin D (5). Not surprisingly, we decided to utilize the methods that were already familiar to us in order to elaborate $\mathbf{1 1 2}$ to the desired natural product (7). To this end, we anticipated that the presence of an amino group $\alpha$ to the ketone would allow for eventual introduction of the aminoimidazole moiety. Therefore, selective deprotection of silyl ether 112, followed by oxidation with Dess-Martin periodinane, produced ketone 113 (Scheme 3.2.8).

## Scheme 3.2.8

### 3.2.4.1 End-Game Strategy 1

Our first effort to functionalize the ketone $\alpha$-position involved a nitration strategy to access a compound analogous to an intermediate employed in the dragmacidin D synthesis (Scheme 3.2.9). Both lithium enolate $\mathbf{1 1 4}$ and TMS enol ether $\mathbf{1 1 5}$ were exposed to electrophilic $\mathrm{NO}_{2}$ sources. ${ }^{24}$ Unfortunately, in all of these cases, formation of the desired nitroketone product (116) was not observed.

Scheme 3.2.9

### 3.2.4.2 End-Game Strategy 2

We then turned to an alternative strategy that would involve installation of an $\alpha$ amino substituent via nucleophilic displacement of an alkylbromide. Therefore, ketone 113 was treated with TMSOTf and then exposed to NBS to afford bromoketone $\mathbf{1 1 7}$ as a
single diastereomer (Scheme 3.2.10). ${ }^{25}$ Interestingly, when bromoketone $\mathbf{1 1 7}$ was treated with various nitrogenous nucleophiles, base-promoted rearrangements were observed. ${ }^{26}$ In fact, reaction of bromide $\mathbf{1 1 7}$ with a basic fluoride anion source (TBAF in THF) gave [3.2.1] bicycle $\mathbf{1 1 8}$ as the major product via a Favorskii rearrangement. ${ }^{27}$ The utilization of amine bases also led to the formation of related Favorskii products.

Scheme 3.2.10

### 3.2.4.3 End-Game Strategy 3: The Total Synthesis of (+)-Dragmacidin F

With limited options remaining, we became interested in the use of a Neber rearrangement in order to install the necessary $\alpha$-amino substituent. ${ }^{28,29}$ In this scenario, an activated oxime derivative would undergo alkoxide-promoted rearrangement to furnish an $\alpha$-aminoketone. Thus, ketone $\mathbf{1 1 3}$ was converted to tosyloxime $\mathbf{1 1 9}$ via standard conditions (Scheme 3.2.11). Gratifyingly, exposure of substrate $\mathbf{1 1 9}$ to aqueous KOH in ethanol led to Neber rearrangement. After optimization, we found that simply exposing tosyloxime $\mathbf{1 1 9}$ to i) KOH , ii) HCl , and iii) $\mathrm{K}_{2} \mathrm{CO}_{3}$ produced $\alpha$-aminoketone $\mathbf{1 2 0}$ as a single regio- and stereochemical isomer in excellent yield. ${ }^{30,31,32}$ Furthermore,
under these reaction conditions, both the tosyl and SEM protective groups were quantitatively removed from their corresponding heterocycles. To the best of our knowledge, this is the first example of a successful Neber rearrangement in the context of natural product synthesis. ${ }^{33}$

Scheme 3.2.11

A more detailed look at the possible mechanism of the Neber rearrangement/deprotection sequence is shown in Scheme 3.2.12. Exposure of tosyloxime $\mathbf{1 1 9}$ to KOH in ethanol likely leads to the formation of detosylated azirine 121, which is attacked by ethoxide to afford ethoxyaziridine $\mathbf{1 2 2} .{ }^{29,34}$ Following acidmediated hydrolysis, the aminoketone moiety is installed with concomitant partial cleavage of the SEM protective group $(\mathbf{1 2 2} \rightarrow \mathbf{1 2 3}) .{ }^{300,35}$ Finally, treatment of hemiaminal 123 with $\mathrm{K}_{2} \mathrm{CO}_{3}$ removes the remaining portion of the SEM group, thus giving rise to the deprotected aminoketone (120).

Scheme 3.2.12

120

In order to unveil the masked pyrazinone functionality, Neber rearrangement product $\mathbf{1 2 0}$ was treated with TMSI at $60{ }^{\circ} \mathrm{C}$ (Scheme 3.2.13). ${ }^{9}$ Fortuitously, both the pyrazinone and the $3^{\circ}$ alcohol functionalities were revealed simultaneously ( $\mathbf{1 2 0} \rightarrow \mathbf{1 2 4}$ ). In the final step of the synthesis, the penultimate aminoketone (124) was subjected to cyanamide and aqueous NaOH to produce enantiopure dragmacidin F (7). ${ }^{36}$ Our efficient and enantiospecific route allows access to 7 in $7.8 \%$ overall yield in just 21 steps from (-)-quinic acid (101).

### 3.3 The Absolute Stereochemistry of the Pyrazinone-Containing Dragmacidins

Synthetic dragmacidin $F(7)$ was spectroscopically identical ( ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, IR, UV, HPLC) to a sample obtained from natural sources (Figure 3.3.1), ${ }^{\text {lb }}$ with the exception of the sign of rotation (natural: $[\alpha]^{25}{ }_{\mathrm{D}}-159^{\circ}(c 0.4, \mathrm{MeOH})$; synthetic: $[\alpha]^{23}{ }_{\mathrm{D}}$ $+146^{\circ}(c 0.45, \mathrm{MeOH})$ ). Thus, our synthesis from (-)-quinic acid (101) established, for the first time, the absolute configuration of natural dragmacidin $\mathrm{F}(7)$ to be $(4 " S, 6 " S$, $6 " \$ S$ ) as shown in Figure 3.3.2. ${ }^{37}$ On the basis of the hypothesis that dragmacidins D, E, and F are biosynthetically related, it is likely that the absolute stereochemical configurations of natural dragmacidins $\mathrm{D}(\mathbf{5})$ and $\mathrm{E}(\mathbf{6})$ are ( 6 '" $S$ ) and ( 5 "' $R, 6$," $S$ ), respectively. Having developed a route to the unnatural antipode of dragmacidin $\mathrm{F}((+)$ -
7), we set out to extend our approach to the total synthesis of (-)-7.

Figure 3.3.2

### 3.4 The Total Synthesis of (-)-Dragmacidin F

### 3.4.1 An Enantiodivergent Strategy for the Preparation of (-)-Dragmacidin F

As described above, naturally occurring and readily available (-)-quinic acid $(\mathbf{1 0 1})^{6}$ had served as the starting material for our synthetic approach to (+)-7. Unfortunately, the (+)-enantiomer of 101 is not easily accessible, ${ }^{38}$ and we were confronted with the possibility that our synthesis would not be amenable to the preparation of our new target molecule, (-)-dragmacidin F ((-)-7). We reasoned, however, that it might be possible to exploit (-)-quinic acid (101) in an enantiodivergent manner that would allow access to both (+)- and (-)-7 (Scheme 3.4.1). ${ }^{39}$ For such an approach to succeed, (-)-quinic acid (101) would be elaborated via selective manipulation of the $\mathrm{C}(3), \mathrm{C}(4)$, and $\mathrm{C}(5)$ hydroxyl groups to a pseudo- $C_{2}$-symmetric ${ }^{40}$ derivative (125) en route to pyrrolocyclohexene 126, the diastereomer of which (i.e., 100)
was employed in our synthesis of (+)-7. Analogous to our approach to (+)-7 (i.e., $\mathbf{1 0 0} \rightarrow$ 98), we anticipated that $\mathbf{1 2 6}$ could undergo oxidative carbocyclization to afford annulated pyrrole 127. Bicycle 127 would then be elaborated to (-)-dragmacidin $\mathrm{F}((-)-7)$. Of the key transformations outlined in Scheme 15, we were familiar with the Pd-mediated oxidative carbocyclizations and the late-stage manipulations of related compounds; however, the successful preparation of (-)-dragmacidin F ((-)-7) would rely heavily on the identification of a suitable quinic acid derivative (125), the facile synthesis of that compound, and the rapid conversion of $\mathbf{1 2 5}$ to the requisite cyclization substrate (126).

Scheme 3.4.1

### 3.4.2 The Development and Investigation of a Reductive Isomerization Reaction

Fortunately, potential solutions to these problems had become apparent during our studies of a novel reductive isomerization reaction discovered in our synthesis of (+)dragmacidin F ((+)-7). Two critical results are shown in Scheme 3.4.2. In the first experiment, treatment of lactone $\mathbf{1 0 3}$ with $\mathrm{Pd} / \mathrm{C}$ and $\mathrm{H}_{2}$ in methanol at $0{ }^{\circ} \mathrm{C}$ furnished carboxylic acid 104 in essentially quantitative yield via reductive loss of the $\mathrm{C}(5)$ carboxylate with concomitant olefin migration (i.e., net $\mathrm{S}_{\mathrm{N}} 2$ ' reduction). In the second experiment, a closely related derivative (105) was exposed to similar reaction conditions. ${ }^{41}$ Surprisingly, the reductive isomerization reaction proceeded with loss of the $\mathrm{C}(3)$ silyl ether rather than the $\mathrm{C}(5)$ acetate, thus producing small quantities of allylic acetate $\mathbf{1 2 8}$ instead of the anticipated product (106). ${ }^{42}$ The observation that $(t$ $\mathrm{Bu}) \mathrm{Me}_{2} \mathrm{SiO}^{-}$was preferentially ejected from compound $\mathbf{1 0 5}$ despite the clear superiority of $\mathrm{AcO}^{-}$as a leaving group led us to consider that the $\mathrm{C}(3)$ silyl ether moiety was positioned in an axial orientation, thereby facilitating its elimination. ${ }^{43}$ This preferred conformation of $\mathbf{1 0 5}$ represents a cyclohexane ring-flip with respect to lactone $\mathbf{1 0 3}$, and thus gives rise to the reductive isomerization product (128) possessing a $\Delta_{3,4}$ olefin. Importantly, the possibility existed that the unexpected product obtained from this reaction (i.e., 128) could be converted to cyclization substrate $\mathbf{1 2 6}$ (diastereomeric to 100).

## Scheme 3.4.2

Our efforts to optimize the reductive isomerization of $\mathbf{1 0 5}$ to $\mathbf{1 2 8}$ were hampered by competitive hydrogenation of the olefin moiety of $\mathbf{1 0 5}$, a complication not observed in the high-yielding conversion of $\mathbf{1 0 3}$ to $\mathbf{1 0 4}$. Although both processes presumably involve the elimination of an axially disposed leaving group, ${ }^{43}$ we reasoned that the successful conversion of $\mathbf{1 0 3}$ to $\mathbf{1 0 4}$ was due to the carboxylate being conformationally restricted to an axial orientation, while substrate $\mathbf{1 0 5}$ possessed a poorer leaving group $\left((t-\mathrm{Bu}) \mathrm{Me}_{2} \mathrm{SiO}^{-}\right)$and was free to adopt alternate conformations (Figure 3.4.1). ${ }^{44} \mathrm{We}$ hypothesized that derivatives of $\mathbf{1 0 5}$ containing an axially-locked leaving group at $\mathrm{C}(3)$
(e.g., 129) would be more suitable substrates for the reductive isomerization reaction.

Thus, carbonate $\mathbf{1 3 0}$ was identified as the key (-)-quinic acid derived intermediate en route to the desired cyclization substrate (126) and became the focus of our efforts.

Figure 3.4.1

Our synthesis of carbonate $\mathbf{1 3 0}$ began with bicyclic lactone 103, a derivative of (-)-quinic acid (101) that was used in our total synthesis of (+)-7 (Scheme 3.4.3). Addition of 2-lithio-SEM-pyrrole ${ }^{14}$ followed by TBS protection afforded bis(silylether) 131 in good yield. This pseudo- $C_{2}$-symmetric compound then underwent rapid diastereoselective mono-desilylation upon treatment with TBAF in THF to produce the syn 1,3-diol 132. ${ }^{45}$ Importantly, this desymmetrization proceeded with complete selectivity and allowed us to efficiently differentiate the $C(3)$ and $C(5)$ positions of the cyclohexyl moiety. Diol $\mathbf{1 3 2}$ was smoothly converted to bicyclic carbonate $\mathbf{1 3 0}$ in the presence of CDI, effectively restricting the $\mathrm{C}(3)$ substituent to an axial disposition. Gratifyingly, exposure of carbonate $\mathbf{1 3 0}$ to our reductive isomerization conditions (2 $\mathrm{mol} \% \mathrm{Pd} / \mathrm{C}, \mathrm{H}_{2}, \mathrm{MeOH}, 0^{\circ} \mathrm{C}$ ) led to the selective formation of the desired cyclization substrate (126) in $90 \%$ yield. ${ }^{46}$

### 3.4.3 Constructing the [3.3.1] Bicycle en Route to (-)-Dragmacidin F

After assembling target substrate 126, we turned our attention to the key $\operatorname{Pd}(I I)-$ mediated cyclization reaction (Scheme 3.4.4). Substrate 126 was treated with 1.2 equiv of $\operatorname{Pd}(\mathrm{OAc})_{2}$ under conditions similar to those described earlier, upon which, the desired pyrrole-fused bicycle (127) formed as a single regio- and stereoisomer. Notably, bond formation between the pyrrole functionality and $\mathrm{C}(3)$ of $\mathbf{1 2 6}$ occurred even in the presence of the bulky $\mathrm{C}(5)$ silyl ether group positioned syn to the acyl pyrrole subunit. Following protection of the $3^{\circ}$ alcohol, [3.3.1] bicycle $\mathbf{1 3 3}$ was obtained in $68 \%$ yield for the two-step process.

Scheme 3.4.4

### 3.4.4 End-Game Studies

### 3.4.4.1 End-Game Strategy 1

En route to (-)-dragmacidin F, cyclization product $\mathbf{1 3 3}$ was converted to pyrazine
134 (Scheme 3.4.5) by methods similar to those described above. ${ }^{30 b}$ Despite the similarity of $\mathbf{1 3 4}$ to its diastereomeric counterpart employed in the synthesis of (+)-7 (112, Scheme 3.2.8), selective desilylation of $\mathbf{1 3 4}$ to afford $\mathbf{1 3 5}$ proved to be difficult. We reasoned that the steric congestion of the axial TBS ether, positioned syn to the methyl stereocenter, was the cause of these problems. In fact, attempted TBS cleavage of parent bicycle 136 was also challenging, even at elevated temperatures. ${ }^{47}$ However, in a critical reaction, the sterically less crowded TBS ether of olefinic substrate $\mathbf{1 3 3}$ underwent smooth and selective cleavage upon treatment with TBAF in THF to afford allylic alcohol 137. With this result in hand, we conceived of a modified route that would ultimately deliver (-)-7 in a more convergent manner.

## Scheme 3.4.5

### 3.4.4.2 End-Game Strategy 2: Rh-Mediated Allylic Isomerization and the Total

## Synthesis of (-)-Dragmacidin F

Since allylic alcohol 137 was readily accessible, we chose to employ it as an intermediate in our synthesis. Oxidation of allylic alcohol 137 followed by olefin reduction afforded ketone 138 in good overall yield (Scheme 3.4.6). However, because alcohol $\mathbf{1 3 7}$ and ketone $\mathbf{1 3 8}$ are in the same overall oxidation state, a tandem olefin isomerization/tautomerization process would be more efficient. Upon exposure of alcohol $\mathbf{1 3 7}$ to Brown's cationic rhodium catalyst $\mathrm{Rh}(\mathrm{nbd})(\mathrm{dppb}) \mathrm{BF}_{4}{ }^{48}$ and $\mathrm{H}_{2}$, ketone $\mathbf{1 3 8}$ formed directly as a single diastereomer in $98 \%$ yield. Interestingly, when diastereomer 139 (closely related to intermediates employed in the synthesis of (+)-dragmacidin F $((+)-7))$ was subjected to the identical conditions, no reaction took place.

Scheme 3.4.6

The discrepancy between the two outcomes can be rationalized after examining the mechanism of the Rh-mediated allylic isomerization reaction, which has been studied extensively. ${ }^{48 b}$ The process begins by interaction of the cationic rhodium complex with an allylic hydrogen atom to form a $\pi$-allyl rhodium complex. In the case of substrate 137, the allylic proton necessary for isomerization is positioned on the convex face of the bicycle, pointed away from the heterocycle (Scheme 3.4.7). Thus, the $\pi$-allyl rhodium intermediate (140) can form without difficulty. $\mathbf{1 4 0}$ then undergoes reductive elimination to enol 141, followed by tautomerization to ketone (+)-138. The newly formed stereocenter in $\mathbf{1 3 8}$ is presumably controlled by thermodynamics, as the methyl group rests in an equatorial position. Substrate 139, in contrast to $\mathbf{1 3 7}$, possesses an axially disposed allylic proton that is positioned syn to the bicycle. It is likely that this proton is severely hindered, making approach of the large cationic rhodium complex difficult. Thus, isomerization of allylic alcohol 139 to ketone (-)-138 (via 142 and 143) does not occur.

Scheme 3.4.7

Elaboration of ketone (+)-138 to (-)-7 proceeded with little difficulty. Regioselective bromination and low-temperature metalation of the pyrrole in the presence of two ketones gave rise to boronic ester 144 (Scheme 3.4.8). Subsequent halogenselective cross-coupling of $\mathbf{1 4 4}$ with dibromide $\mathbf{7 3}$ afforded the desired Suzuki adduct $(-) \mathbf{- 1 1 3}$ ( $89 \%$ yield), the enantiomer of which had been employed in the synthesis of (+)dragmacidin F. Finally, Suzuki adduct (-)-113 was converted to (-)-dragmacidin F ((-)7) via our previously described six-step protocol (vide supra). Synthetic and natural (-)$7^{1 \mathrm{~b}}$ were spectroscopically identical (Figure 3.4.2), including the sign of optical rotation (natural (-)-7: $[\alpha]_{\mathrm{D}}^{25}-159^{\circ}$ (c $0.4, \mathrm{MeOH}$ ); synthetic ( - )-7: $[\alpha]_{\mathrm{D}}^{23}-148^{\circ}$ (c 0.2 , $\mathrm{MeOH})$ ). ${ }^{30 \mathrm{~b}}$

Scheme 3.4.8

### 3.5 Conclusion

In summary, we have developed an enantiodivergent strategy to access both antipodes of dragmacidin $F(7)$ from a single enantiomer of readily available (-)-quinic acid (101). Our highly efficient syntheses provide (+)-7 in $7.8 \%$ overall yield and (-)-7 in $9.3 \%$ overall yield beginning from 101 . The routes that we have developed to (+)- and (-)-7 are concise and feature a number of key transformations, namely: a) highly efficient functionalizations of (-)-101 to differentiate $\mathrm{C}(3)$ and $\mathrm{C}(5)$, b) novel reductive isomerization reactions, c) sterically demanding $\mathrm{Pd}(\mathrm{II})$-mediated oxidative carbocyclizations, d) halogen-selective Suzuki cross-coupling reactions, and e) highyielding late-stage Neber rearrangements. Advanced biological testing of both synthetic antipodes of dragmacidin $F$ is currently underway.

### 3.6 Experimental Section

### 3.6.1 Materials and Methods

Unless stated otherwise, reactions were conducted in flame-dried glassware under an atmosphere of nitrogen using anhydrous solvents (either freshly distilled or passed through activated alumina columns). All commercially obtained reagents were used as received. Reaction temperatures were controlled using an IKAmag temperature modulator. Thin-layer chromatography (TLC) was conducted with E. Merck silica gel 60 F254 pre-coated plates $(0.25 \mathrm{~mm})$ and visualized using a combination of UV, anisaldehyde, ceric ammonium molybdate, and potassium permanganate staining. ICN silica gel (particle size $0.032-0.063 \mathrm{~mm}$ ) was used for flash column chromatography. Disposable Sep-Pak $C_{18}$ Vac Cartridges were purchased from Waters and used for all reversed-phase filtrations. HPLC analysis was performed on a Beckman Gold system using a Rainin $\mathrm{C}_{18}$, Microsorb MV, $5 \mu \mathrm{~m}, 300 \times 4.6 \mathrm{~mm}$ reversed-phased column in $0.1 \%$ $(w / v)$ TFA with acetonitrile $/ \mathrm{H}_{2} \mathrm{O}$ as eluent and a flow rate of $1.0 \mathrm{~mL} / \mathrm{min}$, gradient elution of $1.25 \%$ acetonitrile/min. Preparatory reversed-phase HPLC was performed on a Beckman HPLC with a Waters DeltaPak $25 \times 100 \mathrm{~mm}, 100 \mu \mathrm{~m}_{18}$ column equipped with a guard, $0.1 \%(w / v)$ TFA with acetonitrile $/ \mathrm{H}_{2} \mathrm{O}$ as eluent, and gradient elution of $0.50 \%$ acetonitrile/min. For all reversed-phase purifications, $\mathrm{H}_{2} \mathrm{O}(18 \mathrm{M} \Omega)$ was obtained from a Millipore MiliQ water purification system and TFA from Halocarbon, Inc. ${ }^{1} \mathrm{H}$ NMR spectra were recorded on a Varian Mercury 300 (at 300 MHz ), a Varian Inova 500 (at 500 MHz ), or a Varian Inova $600($ at 600 MHz$)$ and are reported relative to $\mathrm{Me}_{4} \mathrm{Si}(\delta$ 0.0). Data for ${ }^{1} \mathrm{H}$ NMR spectra are reported as follows: chemical shift ( $\delta \mathrm{ppm}$ ), multiplicity, coupling constant $(\mathrm{Hz})$, and integration. ${ }^{13} \mathrm{C}$ NMR spectra were recorded on
a Varian Mercury 300 (at 75 MHz ), or a Varian Inova 500 (at 125 MHz ) and are reported relative to $\mathrm{Me}_{4} \mathrm{Si}(\delta 0.0)$. Data for ${ }^{13} \mathrm{C}$ NMR spectra are reported in terms of chemical shift. IR spectra were recorded on a Perkin Elmer Paragon 1000 spectrometer and are reported in frequency of absorption $\left(\mathrm{cm}^{-1}\right)$. Optical rotations were measured with a Jasco P-1010 polarimeter. High resolution mass spectra were obtained from the California Institute of Technology Mass Spectral Facility.

### 3.6.2 Preparative Procedures

Lactone 145. A mixture of D-(-)-quinic acid (101) (50.0 g, 260.2 mmol ), Amberlyst ${ }^{\circledR} 15$ ion-exchange resin ( $7 \mathrm{~g}, 35 \mathrm{mmol}$ ), benzene ( 500 mL ), and DMF ( 125 mL ) was refluxed under a Dean-Stark trap for 16 h . The reaction mixture was cooled to $23{ }^{\circ} \mathrm{C}$ and filtered over a pad of Celite. The filtrate was then evaporated under reduced pressure to afford a thick oil, which was diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(150 \mathrm{~mL})$. Hexanes (250 mL ) was added and the resulting mixture was allowed to sit at $23^{\circ} \mathrm{C}$ for 2 h . The product was collected by vacuum filtration and was further dried in vacuo to afford lactone $\mathbf{1 4 5}$ $\left(44.9 \mathrm{~g}, 99 \%\right.$ yield) as a white powder. $\mathrm{R}_{f} 0.40$ (3:1 EtOAc:acetone); characterization data for this compound have been previously reported. ${ }^{7 a}$

TBS Lactone 102. To a mixture of lactone 145 ( $90.0 \mathrm{~g}, 517 \mathrm{mmol}$ ), DMAP (6.31 $\mathrm{g}, 51.7 \mathrm{mmol})$, triethylamine ( $90 \mathrm{~mL}, 646 \mathrm{mmol}$ ), and DMF ( 345 mL ) at $-15^{\circ} \mathrm{C}$ was added TBSCl ( $84.9 \mathrm{~g}, 563 \mathrm{mmol}$ ) in 3 equal portions over 30 min . The temperature was maintained between $-20^{\circ} \mathrm{C}$ and $-15{ }^{\circ} \mathrm{C}$ during the addition. The reaction mixture was
allowed to warm to $-5^{\circ} \mathrm{C}$ over 3 h , quenched by the addition of $5 \%$ aq. citric acid (120 mL ), and then warmed to $23^{\circ} \mathrm{C}$. The solvent was removed in vacuo, and the crude product was diluted with $5 \%$ aq. citric acid $(350 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(1 \times 500$ $\mathrm{mL}, 2 \mathrm{x} 400 \mathrm{~mL})$. The combined organic layers were washed with $\mathrm{H}_{2} \mathrm{O}(2 \mathrm{x} 400 \mathrm{~mL})$ and brine ( 400 mL ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure. The product was triturated with hexanes ( 750 mL ) and collected by vacuum filtration. It was further dried under vacuum to afford TBS lactone $102(102.8 \mathrm{~g}, 69 \%$ yield) as a dry white solid. $\mathrm{R}_{f} 0.48$ (1:1 hexanes:EtOAc); $\mathrm{R}_{f} 0.28$ (2:1 $\mathrm{Et}_{2} \mathrm{O}$ :hexanes); characterization data for this compound have been previously reported. ${ }^{7 b}$

Keto Lactone 146. A mixture of TBS lactone $102(3.72 \mathrm{~g}, 12.90 \mathrm{mmol}$ ), powdered $4 \AA ̊$ activated molecular sieves $(2.79 \mathrm{~g})$, Celite $(2.79 \mathrm{~g})$, pyridinium dichromate ( $12.13 \mathrm{~g}, 32.2 \mathrm{mmol}$ ), and acetonitrile ( 185 mL ) was heated to $45^{\circ} \mathrm{C}$ for 24 h . The reaction was allowed to cool to $23{ }^{\circ} \mathrm{C}$, and then was filtered over a plug of silica gel topped with Celite (EtOAc eluent). The solvent was removed under reduced pressure to afford a brown oil, which was further purified by passage over a plug of silica gel (1:1 hexanes:EtOAc). Evaporating the solvent in vacuo afforded keto lactone 146 ( 3.35 g , $91 \%$ yield) as a pale yellow oil.

Alternate Procedure. Powdered $4 \AA$ activated molecular sieves ( 184.6 g ) were agitated and flame-dried under vacuum for approximately 30 min until a fine, powder-
like consistency was obtained. Upon cooling to $23^{\circ} \mathrm{C}, \mathrm{CH}_{2} \mathrm{Cl}_{2}(540 \mathrm{~mL})$ was introduced, and the slurry was cooled to $0{ }^{\circ} \mathrm{C}$. Freshly prepared pyridinium dichromate ${ }^{49}(148.7 \mathrm{~g}$, 395.3 mmol ) was added, and the resulting heterogeneous orange mixture was treated with TBS lactone 102 ( $70.04 \mathrm{~g}, 242.8 \mathrm{mmol}$ ) portionwise over 4 min . After the addition was complete, the reaction was stirred for 5 min and then freshly distilled $\mathrm{AcOH}(49.0 \mathrm{~mL}$, 856.0 mmol ) was added dropwise over a 20 min period. The reaction temperature was maintained at $0^{\circ} \mathrm{C}$ for 15 min after the addition was complete, and the mixture was then stirred at $23{ }^{\circ} \mathrm{C}$. After 10 h , the reaction was judged complete by ${ }^{1} \mathrm{H}$ NMR. The dark mixture was evenly divided into 3 portions, each of which was filtered over a pad of silica gel ( 10 cm diameter x 7.5 cm height, EtOAc eluent). The filtrates were combined and evaporated in vacuo to afford a dark liquid, and this residue was further coevaporated with toluene ( 3 x 150 mL ). The crude product was diluted in a mixture of hexanes:EtOAc (10:1; 250 mL ) and filtered over a pad of powdered $\mathrm{Na}_{2} \mathrm{SO}_{4}$ to remove insoluble impurities. The filtrate was evaporated, and dried in vacuo, to afford keto lactone 146 ( $55.27 \mathrm{~g}, 80 \%$ yield) as a brown, waxy solid. This material was used immediately in the next step without further purification. Unstable to TLC conditions; ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 4.71(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 1 \mathrm{H}), 4.52(\mathrm{dd}, J=10.3 \mathrm{~Hz}, 8.9 \mathrm{~Hz}, 1 \mathrm{H})$, $2.95(\mathrm{~s}, 1 \mathrm{H}), 2.88-2.79(\mathrm{~m}, 1 \mathrm{H}), 2.57-2.47(\mathrm{~m}, 1 \mathrm{H}), 2.39(\mathrm{~d}, J=12.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.13(\mathrm{dd}, J$ $=12.4 \mathrm{~Hz}, 10.5 \mathrm{~Hz}, 1 \mathrm{H}), 0.88(\mathrm{~s}, 9 \mathrm{H}), 0.11(\mathrm{~s}, 3 \mathrm{H}), 0.02(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 75 MHz , $\mathrm{CDCl}_{3}$ ): $\delta 202.6,177.4,79.0,72.0,70.6,43.2,42.6,25.8(3 \mathrm{C}), 18.5,-4.6,-5.3$; IR (film): 3444 (br), 2931, 2858, 1799, 1753, 1254, 1144, $1111 \mathrm{~cm}^{-1} ; \operatorname{HRMS}-\operatorname{FAB}(m / z):[\mathrm{M}+\mathrm{H}]^{+}$ calc'd for $\mathrm{C}_{13} \mathrm{H}_{23} \mathrm{O}_{5} \mathrm{Si}$, 287.1315; found, 287.1316; $[\alpha]^{19}{ }_{\mathrm{D}}{ }^{-96.47^{\circ}}\left(c 1.0, \mathrm{C}_{6} \mathrm{H}_{6}\right)$.

NOTE: Exposure of keto lactone 146 to water (e.g., aqueous workup, or prolonged exposure to silica gel) led to the formation of hydrate 147, as a white powder.

Unstable to TLC conditions; mp 104-6 ${ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}$ ): $\delta 4.46(\mathrm{~d}, J=$ $5.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.75(\mathrm{dd}, J=10.7 \mathrm{~Hz}, 7.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.48-2.31$ (comp. m, 2H), 2.10-2.00 (m, $1 \mathrm{H}), 1.76$ (app. t, $J=11.4 \mathrm{~Hz}, 1 \mathrm{H}), 0.93(\mathrm{~s}, 9 \mathrm{H}), 0.14(\mathrm{~s}, 3 \mathrm{H}), 0.12(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (75 $\left.\mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}\right): \delta 179.4,93.2,81.8,73.0,72.3,41.5,40.9,26.5$ (3C), 19.1, -4.3, -4.7; IR (KBr): 3440 (br), 3374 (br), 2929, 2858, 1782, 1256, 1108, $1070 \mathrm{~cm}^{-1}$; HRMS-CI ( $\mathrm{m} / \mathrm{z}$ ): $[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{13} \mathrm{H}_{24} \mathrm{O}_{6} \mathrm{Si}$, 304.1342; found, 304.1336; $[\alpha]^{19}{ }_{\mathrm{D}}-54.29^{\circ}$ (c 1.0, $\mathrm{MeOH})$.

Methylene Lactone 103. To $\mathrm{CH}_{3} \mathrm{PPh}_{3} \mathrm{Br}(105 \mathrm{mg}, 0.293 \mathrm{mmol})$ in THF ( 2.8 mL ) at $0{ }^{\circ} \mathrm{C}$ was added potassium $t$-butoxide $(31.3 \mathrm{mg}, 0.279 \mathrm{mmol})$. The mixture was warmed to $23{ }^{\circ} \mathrm{C}$ and stirred for an additional 10 min . Keto lactone $\mathbf{1 4 6}(40 \mathrm{mg}, 0.140$ mmol ) in THF ( 1 mL ) was added and stirring was continued at $23^{\circ} \mathrm{C}$ for 15 min . The reaction mixture was then refluxed for 2 h and cooled to $23^{\circ} \mathrm{C}$. The solvent was removed under reduced pressure, and the residue was partitioned between $\mathrm{Et}_{2} \mathrm{O}(3 \mathrm{~mL})$
and brine ( 1.5 mL ). The layers were separated, and the aqueous layer was further extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 1 \mathrm{~mL})$. The combined organic layers were washed with brine $(1.5 \mathrm{~mL})$, dried by passage over a plug of silica gel $\left(\mathrm{Et}_{2} \mathrm{O}\right.$ eluent, then $2: 1$ hexanes: EtOAc eluent), and evaporated under reduced pressure. The crude product was purified by flash chromatography ( $2: 1$ hexanes:EtOAc) to afford methylene lactone 103 ( $30 \mathrm{mg}, 76 \%$ yield) as a white solid.

Alternate Procedure. To $\mathrm{CH}_{3} \mathrm{PPh}_{3} \mathrm{Br}(82.9 \mathrm{~g}, 232.1 \mathrm{mmol})$ in $\mathrm{THF}(1.10 \mathrm{~L})$ at 23 ${ }^{\circ} \mathrm{C}$ was added potassium $t$-butoxide $(23.8 \mathrm{~g}, 212.1 \mathrm{mmol})$ in one portion. The mixture was stirred for 2 h , then cooled to $0^{\circ} \mathrm{C}$. Keto lactone $146(54.5 \mathrm{~g}, 190.3 \mathrm{mmol})$ in THF $(240 \mathrm{~mL})$ was added dropwise over a 30 min period. The reaction was allowed to warm slowly to $23{ }^{\circ} \mathrm{C}$ over 9 h , then quenched by the addition of ice-cold $15 \%$ aq. $\mathrm{NH}_{4} \mathrm{Cl}(500$ mL ). The solvent was evaporated under reduced pressure, and the residue was partitioned between $\mathrm{Et}_{2} \mathrm{O}(500 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(100 \mathrm{~mL})$. The aqueous phase was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 250 \mathrm{~mL})$, and the combined organics were washed with $\mathrm{H}_{2} \mathrm{O}(100 \mathrm{~mL})$ and brine ( 100 mL ) and dried over $\mathrm{MgSO}_{4}$. Evaporation of the solvent afforded a crude yellow oil, which was filtered over a plug of silica gel (4:1 pentane: $\mathrm{Et}_{2} \mathrm{O} \rightarrow 3: 2$ pentane: $\mathrm{Et}_{2} \mathrm{O}$ eluent). After evaporating the solvent in vacuo, the residue was triturated with ice-cold pentane $(40 \mathrm{~mL})$. The white solid was filtered and washed with ice-cold pentane ( $2 \times 2 \mathrm{~mL}$ ). A second crop was collected from the filtrate after concentrating its volume to 15 mL . Drying the collected material in vacuo afforded methylene lactone $\mathbf{1 0 3}$ (22.1 g, $41 \%$ yield) as a white solid. $\mathrm{R}_{f} 0.59$ ( $1: 1$ hexanes:EtOAc); mp $87-88{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR (300 MHz, $\mathrm{CDCl}_{3}$ ): $\delta 5.25-5.23(\mathrm{~m}, 1 \mathrm{H}), 5.13-5.10(\mathrm{~m}, 1 \mathrm{H}), 5.07(\mathrm{~d}, J=6.0 \mathrm{~Hz}$, $1 \mathrm{H}), 4.38-4.29(\mathrm{~m}, 1 \mathrm{H}), 2.85(\mathrm{~s}, 1 \mathrm{H}), 2.67-2.59(\mathrm{~m}, 1 \mathrm{H}), 2.31-2.21(\mathrm{~m}, 1 \mathrm{H}), 2.09(\mathrm{~d}, J=$
$11.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.86$ (app. t, $J=11.3 \mathrm{~Hz}, 1 \mathrm{H}), 0.89(\mathrm{~s}, 9 \mathrm{H}), 0.06(\mathrm{~s}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (75 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 178.1,144.8,111.0,79.4,73.1,67.1,44.7,44.7,26.0$ (3C), 18.5, -4.5, 4.7; IR (film): 3426 (br), 2956, 2931, 2858, 1791, 1254, 1120, $1071 \mathrm{~cm}^{-1}$; HRMS-FAB $(m / z):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{14} \mathrm{H}_{25} \mathrm{O}_{4} \mathrm{Si}$, 285.1522; found, 285.1519; $[\alpha]^{19}{ }_{\mathrm{D}}-101.71^{\circ}(c 1.0$, $\left.\mathrm{CHCl}_{3}\right)$.

Methyl Ester 105. To lactone 103 ( $420 \mathrm{mg}, 1.477 \mathrm{mmol}$ ) and activated ovendried $4 \AA$ molecular sieves $(100 \mathrm{mg})$ was added $\mathrm{MeOH}(15 \mathrm{~mL})$. The reaction mixture was stirred at $23{ }^{\circ} \mathrm{C}$ for 5.5 h , then filtered over a short plug of Celite (EtOAc eluent). After evaporation of the reaction mixture under reduced pressure, the residue was purified by flash column chromatography ( $2: 1$ hexanes:EtOAc eluent) to afford starting material lactone $103(82 \mathrm{mg}, 20 \%$ yield) and siloxy diol $148(345 \mathrm{mg}, 74 \%$ yield, $92 \%$ yield based on recovered starting material), which was used directly in the subsequent reaction.

To siloxy diol $148(80.0 \mathrm{mg}, 0.253 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.5 \mathrm{~mL})$ was added $\mathrm{Et}_{3} \mathrm{~N}$ $(71 \mu \mathrm{~L}, 0.506 \mathrm{mmol})$, DMAP $(3 \mathrm{mg}, 0.0253 \mathrm{mmol})$, followed by $\mathrm{Ac}_{2} \mathrm{O}(31 \mu \mathrm{~L}, 0.329$ $\mathrm{mmol})$. The reaction mixture was stirred at $23{ }^{\circ} \mathrm{C}$ for 10 min , quenched with saturated aq. $\mathrm{NaHCO}_{3}(5 \mathrm{~mL})$, and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 15 \mathrm{~mL})$. The combined organic layers were filtered over a plug of silica gel $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ eluent, then EtOAc eluent) and evaporated under reduced pressure. The crude product was purified by flash
chromatography (3:1 hexanes:EtOAc eluent) to afford methyl ester $\mathbf{1 0 5}(89.0 \mathrm{mg}, \mathbf{9 8 \%}$ yield) as a colorless oil. $\mathrm{R}_{f} 0.50$ ( $1: 1$ hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta$ 5.90-5.81(m, 1H), 4.96(br s, 1H), $4.94(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 4.91-4.89(\mathrm{~m}, 1 \mathrm{H}), 4.67($ app. $\mathrm{t}, \mathrm{J}=$ $3.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.74(\mathrm{~s}, 3 \mathrm{H}), 2.38(\mathrm{ddd}, J=12.7,5.2,2.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.19-2.03$ (comp. m, 2H), $2.09(\mathrm{~s}, 3 \mathrm{H}), 1.93($ app. $\mathrm{t}, J=12.1 \mathrm{~Hz}, 1 \mathrm{H}), 0.87(\mathrm{~s}, 9 \mathrm{H}), 0.09(\mathrm{~s}, 3 \mathrm{H}), 0.08(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 173.7,169.6,146.3,108.5,76.5,75.1,68.0,52.9,42.7,41.2$, 25.8 (3C), 21.1, 18.1, -4.6, -5.2; IR (film) 3464 (br), 2954, 2932, 2858, 2888, 1739 (br), 1369, 1233 (br), 1124, 1098, 1072, $1036 \mathrm{~cm}^{-1}$; HRMS-FAB ( $\mathrm{m} / \mathrm{z}$ ): $[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{17} \mathrm{H}_{31} \mathrm{O}_{6} \mathrm{Si}, 359.1890$; found, $359.1900 ;[\alpha]^{26}{ }_{\mathrm{D}}-26.61^{\circ}\left(c\right.$ 1.0, $\left.\mathrm{C}_{6} \mathrm{H}_{6}\right)$.

105

Siloxycyclohexene 106. Methyl ester $105(94 \mathrm{mg}, 0.262 \mathrm{mmol}), \mathrm{Pd}\left(\mathrm{P}\left(t-\mathrm{Bu}_{3}\right)_{2}\right)$ (40.2 mg, 0.0786 mmol ), anhydrous $N$-methylmorpholine $N$-oxide ( $307 \mathrm{mg}, 2.52 \mathrm{mmol}$ ), THF ( 5.2 mL ), and freshly distilled $\mathrm{Et}_{3} \mathrm{SiH}(1.67 \mathrm{~mL}, 10.5 \mathrm{mmol})$ were combined under a glovebox atmosphere. The reaction mixture was immediately removed from the glovebox and placed in a $70^{\circ} \mathrm{C}$ oil bath. After 3.5 h , the reaction mixture was cooled to $0{ }^{\circ} \mathrm{C}$, and the volatiles were removed under reduced pressure. Saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}(15$ mL ) was added, and the mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 25 \mathrm{~mL})$. The combined organic layers were washed with brine ( 15 mL ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure. The crude product was purified by flash chromatography (5:1 hexanes:EtOAc eluent) to afford siloxycyclohexene 106 ( $70 \mathrm{mg}, 89 \%$ yield) as a pale
yellow oil. $\mathrm{R}_{f} 0.55$ (2:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 5.49-5.42(\mathrm{~m}$, $1 \mathrm{H}), 4.62(\mathrm{~s}, 1 \mathrm{H}), 4.18-4.12(\mathrm{~m}, 1 \mathrm{H}), 3.76(\mathrm{~s}, 3 \mathrm{H}), 2.45-2.38(\mathrm{comp} . \mathrm{m}, 2 \mathrm{H}), 2.16-2.10$ (comp. m, 2H), 1.79-1.74 (m, 3H), $0.88(\mathrm{~s}, 9 \mathrm{H}), 0.13(\mathrm{~s}, 3 \mathrm{H}), 0.12(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (75 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 175.3,133.7,120.9,73.0,68.7,52.6,38.4,36.9,25.9$ (3C), 21.4, 18.0, 4.3, -4.7; IR (film) 3478 (br), 2955, 2858, 1740, 1451, 1253, 1217, 1111, 1065, $1037 \mathrm{~cm}^{-}$ ${ }^{1}$; HRMS-FAB $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{15} \mathrm{H}_{19} \mathrm{O}_{4} \mathrm{Si}$, 301.1835; found, 301.1835; [ $\left.\alpha\right]^{24}{ }_{\mathrm{D}}$ $+77.62^{\circ}\left(c 0.47, \mathrm{CHCl}_{3}\right)$.

Acid 104. A mixture of methylene lactone $103(4.0 \mathrm{~g}, 14.1 \mathrm{mmol})$ and $10 \% \mathrm{Pd} / \mathrm{C}$ $(80 \mathrm{mg}, 0.075 \mathrm{mmol})$ in methanol $(120 \mathrm{~mL})$ was cooled to $0^{\circ} \mathrm{C}$. The reaction vessel was evacuated and back-filled with $\mathrm{H}_{2}(3 \mathrm{x})$. After 7 h at $0^{\circ} \mathrm{C}$, the mixture was filtered over a pad of Celite (MeOH eluent), and the solvent was evaporated under reduced pressure to afford a colorless oil. Residual solvent was removed by holding the crude product under vacuum for 10 h , providing acid 104 ( 4.0 g , $99 \%$ yield), which was used immediately without further purification. $\mathrm{R}_{f} 0.28$ (1:1 hexanes:EtOAc; $1 \%$ acetic acid); ${ }^{1} \mathrm{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 5.88(\mathrm{~s}, 1 \mathrm{H}), 5.53-5.48(\mathrm{~m}, 1 \mathrm{H}), 4.16-4.11(\mathrm{~m}, 1 \mathrm{H}), 2.71-2.60(\mathrm{~m}, 1 \mathrm{H})$, 2.36-2.22 (m, 1H), $2.18(\mathrm{dd}, J=14.3 \mathrm{~Hz}, 3.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.08-2.01(\mathrm{~m}, 1 \mathrm{H}), 1.79-1.76(\mathrm{~m}$, $3 \mathrm{H}), 0.89(\mathrm{~s}, 9 \mathrm{H}), 0.15-0.13$ (comp. m, 6 H ); ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 176.4,133.2$, 121.1, 73.6, 68.6, 37.9, 35.9, 25.8 (3C), 21.4, 18.0, -4.5, -4.7; IR (film): 3356 (br), 2956,

2931, 2858, 1768 (br), 1718 (br), 1255, $1063 \mathrm{~cm}^{-1}$; HRMS-FAB $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{14} \mathrm{H}_{27} \mathrm{O}_{4} \mathrm{Si}$, 287.1679; found, 287.1675; [ $\left.\alpha\right]^{19}{ }_{\mathrm{D}}+37.58^{\circ}\left(c 1.0, \mathrm{C}_{6} \mathrm{H}_{6}\right)$.

Weinreb Amide 109. To acid $\mathbf{1 0 4}(4.0 \mathrm{~g}, 14.1 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(70 \mathrm{~mL})$ at 23 ${ }^{\circ} \mathrm{C}$ was added 1,1 '-carbonyldiimidazole ( $3.65 \mathrm{~g}, 22.5 \mathrm{mmol}$ ) in equal portions over 15 min. After the final addition, stirring was continued for 10 min , then $\mathrm{N}, \mathrm{O}$ dimethylhydroxylamine • $\mathrm{HCl}(3.43 \mathrm{~g}, 35.16 \mathrm{mmol})$ was added in one portion. The reaction was allowed to stir at $23^{\circ} \mathrm{C}$ for $3 \mathrm{~h} . \mathrm{Et}_{2} \mathrm{O}$ was added ( 50 mL ), and the reaction mixture was filtered. The filtrate was evaporated, diluted with $\mathrm{Et}_{2} \mathrm{O}(125 \mathrm{~mL})$, washed with $5 \%$ aq. citric acid ( $2 \times 50 \mathrm{~mL}$ ) and brine ( 50 mL ), and dried over $\mathrm{MgSO}_{4}$. The crude product was purified by flash chromatography ( $3: 1$ hexanes:EtOAc) to afford Weinreb amide 109 ( $4.29 \mathrm{~g}, 93 \%$ yield) as a colorless oil. $\mathrm{R}_{f} 0.42$ ( $2: 1$ hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR (300 MHz, $\left.\mathrm{CDCl}_{3}\right): \delta 5.43(\mathrm{~m}, 1 \mathrm{H}), 4.72(\mathrm{~s}, 1 \mathrm{H}), 4.17-4.11(\mathrm{~m}, 1 \mathrm{H}), 3.71(\mathrm{~s}, 3 \mathrm{H}), 3.22(\mathrm{~s}$, $3 \mathrm{H}), 2.59-2.24$ (comp. m, 3H), $2.03(\mathrm{dd}, J=14.6 \mathrm{~Hz}, 4.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.75-1.71(\mathrm{~m}, 3 \mathrm{H})$, $0.86(\mathrm{~s}, 9 \mathrm{H}), 0.11(\mathrm{~s}, 3 \mathrm{H}), 0.09(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}, 15 / 16 \mathrm{C}$ ): $\delta 133.5$, $121.5,74.3,69.4,61.2,38.1,35.9,26.0,25.9$ (3C), 21.3, 18.1, -4.3, -4.7; IR (film): 3463 (br), 2956, 2932, 2858, 1655, 1362, $1254 \mathrm{~cm}^{-1}$; HRMS-EI $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{16} \mathrm{H}_{32} \mathrm{NO}_{4} \mathrm{Si}, 330.2101$; found, $330.2085 ;[\alpha]^{19}{ }_{\mathrm{D}}+41.13^{\circ}\left(c 1.0, \mathrm{CHCl}_{3}\right)$.

Dibromopyrrole 151. A solution of 4,5-dibromopyrrole carboxylic acid (149) ${ }^{50}$ $(6.05 \mathrm{~g}, 22.5 \mathrm{mmol})$ in ethanolamine ( 36 mL ) was heated to $100^{\circ} \mathrm{C}$ for 2 h , cooled to 23 ${ }^{\circ} \mathrm{C}$, and poured into a mixture of $\mathrm{Et}_{2} \mathrm{O}(200 \mathrm{~mL})$ and 0.5 N aq. $\mathrm{HCl}(300 \mathrm{~mL})$. The layers were separated, and the aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 250 \mathrm{~mL})$. The combined organic layers were washed with brine ( 200 mL ), dried over $\mathrm{MgSO}_{4}$, and concentrated to 100 mL . The solution was diluted with hexanes $(100 \mathrm{~mL})$, filtered over a plug of silica gel ( $2: 1$ hexanes: $\mathrm{Et}_{2} \mathrm{O}$ ), and concentrated to 150 mL . THF ( 100 mL ) was added, and the solution was concentrated to 100 mL . This solvent exchange procedure was repeated 2 additional times ( $2 \times 100 \mathrm{~mL}$ THF) to afford 2,3-dibromopyrrole (150) as a solution in THF, which was used immediately in the subsequent reaction.

CAUTION: Concentrating the above described solutions to dryness or neardryness leads to rapid decomposition of 2,3-dibromopyrrole (150). ${ }^{22}$

To 2,3-dibromopyrrole (150) in THF at $-20^{\circ} \mathrm{C}$ was added NaH ( $60 \%$ dispersion in mineral oil, $1.51 \mathrm{~g}, 37.8 \mathrm{mmol}$ ) in 3 equal portions over 3 min . After 10 min at -20 ${ }^{\circ} \mathrm{C}$, $\mathrm{SEMCl}(4.8 \mathrm{~mL}, 27.1 \mathrm{mmol})$ was added dropwise over 1 min . The reaction mixture was allowed to warm to $-8{ }^{\circ} \mathrm{C}$ over 40 min and was then quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}(30 \mathrm{~mL})$. After warming to $23^{\circ} \mathrm{C}$, the reaction mixture was diluted with $\mathrm{Et}_{2} \mathrm{O}(75$ $\mathrm{mL})$ and $\mathrm{H}_{2} \mathrm{O}(20 \mathrm{~mL})$, and the layers were separated. The aqueous layer was further extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 50 \mathrm{~mL})$. The combined organic layers were washed with brine
( 50 mL ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure. The crude product was purified by flash chromatography (6:1 hexanes: $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, then $4: 1$ hexanes: $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) to afford dibromopyrrole $151\left(6.25 \mathrm{~g}, 79 \%\right.$ yield) as a yellow oil. $\mathrm{R}_{f} 0.17$ (6:1 hexanes: $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 6.82(\mathrm{~d}, J=3.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.25(\mathrm{~d}, J=$ $3.3 \mathrm{~Hz}, 1 \mathrm{H}), 5.21(\mathrm{~s}, 2 \mathrm{H}), 3.48(\mathrm{t}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 0.88(\mathrm{t}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}),-0.03(\mathrm{~s}, 9 \mathrm{H})$; ${ }^{13} \mathrm{C}$ NMR (75 MHz, $\mathrm{CDCl}_{3}$ ): $\delta 123.1,112.3,103.7,99.8,77.8,66.2,17.9,-1.2$ (3C); IR (film): 2953, 2896, 1514, 1470, 1279, 1250, 1109, $1084 \mathrm{~cm}^{-1} ; \operatorname{HRMS}-E I(\mathrm{~m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$ calc'd for $\mathrm{C}_{10} \mathrm{H}_{17} \mathrm{NOSiBr}_{2}, 352.9446$; found, 352.9435.

Bromo Acyl Pyrrole 99. To dibromopyrrole 151 ( $6.02 \mathrm{~g}, 17.06 \mathrm{mmol}$ ) in THF $(114 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$ was added $n-\operatorname{BuLi}(2.5 \mathrm{M}$ in hexanes, $6.7 \mathrm{~mL}, 16.8 \mathrm{mmol})$ dropwise over 1 min . After 10 min at $-78^{\circ} \mathrm{C}$, Weinreb amide $\mathbf{1 0 9}$ ( $1.58 \mathrm{~g}, 4.80 \mathrm{mmol}$ ) in THF ( 15 mL ) was added dropwise over 30 seconds. The reaction vessel was immediately warmed to $0{ }^{\circ} \mathrm{C}$, stirred for 90 min , and cooled to $-78{ }^{\circ} \mathrm{C}$. The reaction was quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}(15 \mathrm{~mL})$, then warmed to $23{ }^{\circ} \mathrm{C}$. The volatiles were removed in vacuo, and the residue was partitioned between $\mathrm{Et}_{2} \mathrm{O}(75 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(30 \mathrm{~mL})$. The layers were separated, and the aqueous layer was further extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 50 \mathrm{~mL})$. The combined organic layers were washed with brine ( 50 mL ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure. The crude product was purified by flash chromatography (11:9 $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ :hexanes) to afford bromo acyl pyrrole $99(1.47 \mathrm{~g}, 56 \%$
yield) as a colorless oil. $\mathrm{R}_{f} 0.29$ (11:9 hexanes: $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 6.77(\mathrm{~d}, J=2.9 \mathrm{~Hz}, 1 \mathrm{H}), 6.20(\mathrm{~d}, \mathrm{~J}=2.7 \mathrm{~Hz}, 1 \mathrm{H}), 5.53-5.47(\mathrm{~m}, 1 \mathrm{H}), 5.35(\mathrm{~d}, J=10.4$ $\mathrm{Hz}, 1 \mathrm{H}), 5.29(\mathrm{~d}, J=10.4 \mathrm{~Hz}, 1 \mathrm{H}), 4.72(\mathrm{~s}, 1 \mathrm{H}), 4.18-4.14(\mathrm{~m}, 1 \mathrm{H}), 3.31(\mathrm{t}, J=8.2 \mathrm{~Hz}$, $2 \mathrm{H}), 2.65-2.53(\mathrm{~m}, 1 \mathrm{H}), 2.53-2.41(\mathrm{~m}, 1 \mathrm{H}), 2.32(\mathrm{dt}, J=14.3 \mathrm{~Hz}, 1.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.15(\mathrm{dd}, J$ $=14.2 \mathrm{~Hz}, 4 \mathrm{~Hz}, 1 \mathrm{H}), 1.79-1.76(\mathrm{~m}, 3 \mathrm{H}), 0.87(\mathrm{~s}, 9 \mathrm{H}), 0.81(\mathrm{t}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 0.12(\mathrm{~s}$, $6 \mathrm{H}),-0.06(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (75 MHz, $\mathrm{CDCl}_{3}$ ): $\delta 201.9,133.2,129.6,125.0,121.6$, $112.5,101.8,78.9,78.6,68.9,66.2,38.6,37.4,26.0$ (3C), 21.5, 18.1, 17.8, -1.2 (3C), 4.1, -4.7; IR (film): 3477 (br), 2953, 1664 (br), 1400, 1253, $1101 \mathrm{~cm}^{-1}$; HRMS-EI ( $\mathrm{m} / \mathrm{z}$ ): $[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{24} \mathrm{H}_{43} \mathrm{NO}_{4} \mathrm{Si}_{2} \mathrm{Br}$, 544.1914; found, 544.1903; $[\alpha]^{19}{ }_{\mathrm{D}}+1.64^{\circ}$ (c 1.0, $\mathrm{CHCl}_{3}$ ).

Bromopyrrole 153. To SEM pyrrole $\mathbf{1 5 2}^{14}(1.25 \mathrm{~g}, 6.33 \mathrm{mmol})$ in THF ( 125 mL ) at $23{ }^{\circ} \mathrm{C}$ was added freshly recrystallized NBS ( $1.127 \mathrm{~g}, 6.33 \mathrm{mmol}$ ) in one portion. After stirring for 5 min , additional NBS was added ( $15 \mathrm{mg}, 0.084 \mathrm{mmol}$ ), and the reaction was immediately judged complete by TLC. The reaction mixture was poured into saturated aq. $\mathrm{NaHCO}_{3}(100 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(1 \times 100 \mathrm{~mL}, 2 \times 50 \mathrm{~mL})$. The combined organic layers were washed with brine ( 75 mL ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure. The crude product was purified by passage over a plug of silica gel $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ eluent) to afford bromopyrrole $\mathbf{1 5 3}(1.73 \mathrm{~g}, 99 \%$ yield) as a pale yellow oil. $\mathrm{R}_{f} 0.53$ (1:1 $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ :hexanes); ${ }^{1} \mathrm{H} \mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 6.83$ (app. $\mathrm{t}, J=2.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.18-6.16(\mathrm{comp} . \mathrm{m}, 2 \mathrm{H}), 5.22(\mathrm{~s}, 2 \mathrm{H}), 3.53-3.46(\mathrm{~m}, 2 \mathrm{H}), 0.92-0.85$
$(\mathrm{m}, 2 \mathrm{H}),-0.03(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (75 MHz, $\left.\mathrm{CDCl}_{3}\right): \delta 122.9,111.9,110.1,102.0,76.7$, 66.0, 17.9, -1.2 (3C); IR (film): 2953, 2895, 1264, 1249, 1108, $1085 \mathrm{~cm}^{-1}$; HRMS-EI $(m / z):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{10} \mathrm{H}_{18} \mathrm{NOSiBr}$, 275.0341; found, 275.0331.

Acyl Pyrrole 100. To bromopyrrole 153 ( $1.73 \mathrm{~g}, 6.26 \mathrm{mmol})$ in THF ( 42 mL ) at $-78{ }^{\circ} \mathrm{C}$ was added $n$-BuLi ( 2.25 M in hexanes, $2.7 \mathrm{~mL}, 6.16 \mathrm{mmol}$ ) dropwise over 1 min . After 10 min at $-78{ }^{\circ} \mathrm{C}$, Weinreb amide $109(655 \mathrm{mg}, 1.99 \mathrm{mmol})$ in THF ( 5 mL ) was added dropwise over 1 min . The reaction vessel was immediately warmed to $0{ }^{\circ} \mathrm{C}$, stirred for 25 min , and cooled to $-78{ }^{\circ} \mathrm{C}$. The reaction mixture was quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}(10 \mathrm{~mL})$, then warmed to $23{ }^{\circ} \mathrm{C}$. The volatiles were removed under reduced pressure. The residue was partitioned between $\mathrm{Et}_{2} \mathrm{O}(75 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(50 \mathrm{~mL})$, and the layers were separated. The aqueous layer was further extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 40$ mL ). The combined organic layers were washed with brine ( 50 mL ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure. The crude product was purified by flash chromatography (23:1 hexanes:EtOAc, then $15: 1$ hexanes:EtOAc) to afford acyl pyrrole 100 ( $656 \mathrm{mg}, 71 \%$ yield) as a colorless oil. $\mathrm{R}_{f} 0.30$ (9:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR (300 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 7.66(\mathrm{dd}, J=4.0 \mathrm{~Hz}, 1.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.06(\mathrm{dd}, J=2.5 \mathrm{~Hz}, 1.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.19$ $(\mathrm{dd}, J=4.0 \mathrm{~Hz}, 2.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.71(\mathrm{~d}, J=10.4 \mathrm{~Hz}, 1 \mathrm{H}), 5.67(\mathrm{~d}, J=10.0 \mathrm{~Hz}, 1 \mathrm{H}), 5.52-$ $5.47(\mathrm{~m}, 1 \mathrm{H}), 4.90(\mathrm{~s}, 1 \mathrm{H}), 4.19($ app. $\mathrm{t}, J=3.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.51(\mathrm{t}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 2.52-$ 2.46 (comp. m, 2H), 2.19-2.16 (comp. m, 2H), 1.80-1.78 (m, 3H), 0.92-0.88 (comp. m,

Alternate Procedure. To acyl pyrrole 100 ( $106.0 \mathrm{mg}, 0.227 \mathrm{mmol}$ ) was added $\mathrm{Pd}(\mathrm{OAc})_{2}(51.1 \mathrm{mg}, 0.227 \mathrm{mmol})$, DMSO ( $32.3 \mu \mathrm{~L}, 0.455 \mathrm{mmol}$ ), $t$ - $\mathrm{BuOH}(18.2 \mathrm{~mL})$, and $\mathrm{AcOH}(4.5 \mathrm{~mL})$. The mixture was heated to $60^{\circ} \mathrm{C}$ for 10 h , cooled to $23^{\circ} \mathrm{C}$, and filtered over a plug of silica gel (3:1 hexanes:EtOAc). The solvent was evaporated, and the residue was again filtered over a plug of silica gel (3:1 hexanes:EtOAc). After removal of solvent in vacuo, the product was purified by flash chromatography on silica gel (6:1 hexanes:EtOAc) to afford [3.3.1] bicycle 98 ( $78.4 \mathrm{mg}, 74 \%$ yield) as a pale yellow oil.

Reduced [3.3.1] Bicycle 154. [3.3.1] bicycle 98 ( $360 \mathrm{mg}, 0.78 \mathrm{mmol}$ ), $10 \% \mathrm{Pd} / \mathrm{C}$ ( $130 \mathrm{mg}, 0.12 \mathrm{mmol}$ ), and EtOAc ( 8 mL ) were combined, and the reaction vessel was evacuated and back-filled with $\mathrm{H}_{2}(1 \mathrm{~atm})$. The reaction mixture was stirred under $\mathrm{H}_{2}$ for 30 min , then filtered over a plug of silica gel topped with Celite (EtOAc eluent) to afford
reduced [3.3.1] bicycle $\mathbf{1 5 4}$ as a colorless oil ( 358 mg , $99 \%$ yield). $\mathrm{R}_{f} 0.28$ (5:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 6.55(\mathrm{~d}, J=2.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.74(\mathrm{~d}, J=2.5$ $\mathrm{Hz}, 1 \mathrm{H}), 5.56(\mathrm{~d}, J=10.2 \mathrm{~Hz}, 1 \mathrm{H}), 5.30(\mathrm{~d}, J=10.2 \mathrm{~Hz}, 1 \mathrm{H}), 4.27(\mathrm{~s}, 1 \mathrm{H}), 3.59-3.45(\mathrm{~m}$, $2 \mathrm{H}), 3.19$ (ddd, $J=12.9 \mathrm{~Hz}, 7.7 \mathrm{~Hz}, 3.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.58(\mathrm{dd}, J=6.5 \mathrm{~Hz}, 3.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.37-$ 2.20 (comp. m, 2H), 2.06-1.90 (comp. m, 2H), 1.63-1.50 (m, 1H), $1.00(\mathrm{~d}, J=6.6 \mathrm{~Hz}$, $3 \mathrm{H}), 0.94-0.89\left(\right.$ comp. m, 11H), -0.02 (s, 9H), -0.06 (s, 3H), -0.09 (s, 3H), ${ }^{13} \mathrm{C}$ NMR (75 $\left.\mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}\right): \delta 190.8,140.4,131.3,125.2,110.1,76.6,75.6,71.8,66.1,46.8,44.3,40.0$, 37.3, 25.9 (3C), 18.1, 17.9, 16.5, -1.2 (3C), -4.0, -4.6; IR (film): 3473 (br), 2953, 2931, 2857, 1651, 1420, 1249, $1079 \mathrm{~cm}^{-1}$; HRMS-EI $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{24} \mathrm{H}_{44} \mathrm{NO}_{4} \mathrm{Si}_{2}$, 466.2809; found, 466.2804; $[\alpha]^{19}{ }_{\mathrm{D}}-166.30^{\circ}\left(c 1.0, \mathrm{C}_{6} \mathrm{H}_{6}\right)$.

NOTE: In some instances, trace phosphine contaminants from the Heck reaction (i.e., $\mathbf{9 9} \boldsymbol{\rightarrow 9 8}$ ) prevented the reduction from occurring. Simply working up the reaction and re-exposing it to the identical reaction conditions (as described above) allowed the reduction to proceed.

Methyl Ether 111. To reduced [3.3.1] bicycle 154 ( $358 \mathrm{mg}, 0.77 \mathrm{mmol}$ ) in THF $(7.7 \mathrm{~mL})$ at $23^{\circ} \mathrm{C}$ was added $\mathrm{NaH}(60 \%$ dispersion in mineral oil, $123 \mathrm{mg}, 3.08 \mathrm{mmol})$. After stirring for 2 min at $23^{\circ} \mathrm{C}$, MeI was added $(335 \mu \mathrm{~L}, 5.38 \mathrm{mmol})$. The resulting mixture was stirred for 1 h , cooled to $0{ }^{\circ} \mathrm{C}$, and quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}(4$ $\mathrm{mL})$, then warmed to $23{ }^{\circ} \mathrm{C} . \mathrm{Et}_{2} \mathrm{O}(10 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$ were added, and the layers
were separated. The aqueous layer was further extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 15 \mathrm{~mL})$. The combined organic layers were washed with brine ( 20 mL ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure. The crude product was purified by flash chromatography (4:1 hexanes:EtOAc) to afford methyl ether 111 ( $354 \mathrm{mg}, 96 \%$ yield) as a colorless oil. $\mathrm{R}_{f} 0.34$ (5:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}\right): \delta 6.58(\mathrm{~d}, J=$ $2.8 \mathrm{~Hz}, 1 \mathrm{H}), 5.78(\mathrm{~d}, J=2.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.57(\mathrm{~d}, J=10.2 \mathrm{~Hz}, 1 \mathrm{H}), 5.54(\mathrm{~d}, J=10.2 \mathrm{~Hz}$, $1 \mathrm{H}), 3.65-3.50(\mathrm{~m}, 2 \mathrm{H}), 3.37(\mathrm{~s}, 3 \mathrm{H}), 3.22$ (ddd, $J=12.9 \mathrm{~Hz}, 7.9 \mathrm{~Hz}, 3.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.68$ $(\mathrm{dd}, J=6.5 \mathrm{~Hz}, 3.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.59-2.49$ (comp. m, 2H), $1.86(\mathrm{dd}, J=12.4 \mathrm{~Hz}, 11.3 \mathrm{~Hz}$, $1 \mathrm{H}), 1.72-1.56(\mathrm{~m}, 2 \mathrm{H}), 1.04(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H}), 0.93-0.85(\mathrm{comp} . \mathrm{m}, 11 \mathrm{H}),-0.02(\mathrm{~s}$, 9H), -0.07 (s, 3H), -0.10 ( $\mathrm{s}, 3 \mathrm{H}$ ) ; ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}, 24 / 25 \mathrm{C}$ ): $\delta 189.4,138.3$, $130.4,109.7,81.9,76.9,72.4,66.2,51.8,45.9,41.3,41.2,37.6,26.4$ (3C), 18.5, 18.3, 17.0, -0.9 (3C), -3.6, -4.4; IR (film): 2954, 1657, 1421, 1250, $1085 \mathrm{~cm}^{-1} ; \operatorname{HRMS}-\mathrm{EI}(\mathrm{m} / \mathrm{z})$ : $[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{25} \mathrm{H}_{46} \mathrm{NO}_{4} \mathrm{Si}_{2}, 480.2965$; found, 480.2970; $[\alpha]^{19}{ }_{\mathrm{D}}-172.9^{\circ}$ (c 1.0, $\mathrm{C}_{6} \mathrm{H}_{6}$.

Bromide 155. To methyl ether 111 ( $305 \mathrm{mg}, 0.64 \mathrm{mmol}$ ) in THF ( 6 mL ) at $0^{\circ} \mathrm{C}$ was added freshly recrystallized NBS ( $147 \mathrm{mg}, 0.83 \mathrm{mmol}$ ). After stirring for 10 min at $0^{\circ} \mathrm{C}$, the reaction mixture was warmed to $23^{\circ} \mathrm{C}$, and additional NBS ( $30 \mathrm{mg}, 0.17 \mathrm{mmol}$ ) was added. After 5 min , the reaction was quenched with saturated aq. $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$, diluted with $\mathrm{H}_{2} \mathrm{O}(15 \mathrm{~mL})$, and extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 15 \mathrm{~mL})$. The combined organic layers
were washed with brine ( 15 mL ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure. The crude product was purified by flash chromatography (5:1 hexanes:EtOAc) to afford bromide $\mathbf{1 5 5}$ ( $340 \mathrm{mg}, 96 \%$ yield) as a colorless oil. $\mathrm{R}_{f} 0.55$ (3:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 6.57(\mathrm{~s}, 1 \mathrm{H}), 5.46(\mathrm{~d}, J=10.2 \mathrm{~Hz}, 1 \mathrm{H})$, $5.34(\mathrm{~d}, J=10.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.57-3.41(\mathrm{~m}, 2 \mathrm{H}), 3.32-3.20(\mathrm{~m}, 4 \mathrm{H}), 2.88(\mathrm{dd}, J=6.5 \mathrm{~Hz}, 3.2$ $\mathrm{Hz}, 1 \mathrm{H}), 2.46(\mathrm{ddd}, J=12.2 \mathrm{~Hz}, 5.1 \mathrm{~Hz}, 2.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.28(\mathrm{app} . \mathrm{dt}, J=7.4 \mathrm{~Hz}, 4.0 \mathrm{~Hz}$, $1 \mathrm{H}), 1.78$ (app. t, $J=11.8 \mathrm{~Hz}, 1 \mathrm{H}), 1.69-1.57(\mathrm{~m}, 1 \mathrm{H}), 1.52(\mathrm{dd}, J=11.8 \mathrm{~Hz}, 3.0 \mathrm{~Hz}$, $1 \mathrm{H}), 1.19(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H}), 0.91-0.80(\mathrm{comp} . \mathrm{m}, 11 \mathrm{H}),-0.05(\mathrm{~s}, 9 \mathrm{H}),-0.09(\mathrm{~s}, 3 \mathrm{H})$, 0.12 (s, 3H); ${ }^{13} \mathrm{C}$ NMR (75 MHz, $\mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 189.6,147.2,137.2,130.1,98.4,81.8,77.0$, $72.1,66.6,51.8,45.8,42.4,41.0,35.9,26.3$ (3C), 18.5, 18.3, 17.8, -0.9 (3C), -3.7, -4.3; IR (film): 2954, 2930, 1664, 1249, $1089 \mathrm{~cm}^{-1}$; HRMS-EI $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}-\mathrm{H}_{2}$ calc'd for $\mathrm{C}_{25} \mathrm{H}_{43} \mathrm{NO}_{4} \mathrm{Si}_{2} \mathrm{Br}$, 556.1914; found, 556.1928; [ $\left.\alpha\right]^{19}{ }_{\mathrm{D}}{ }^{-98.22^{\circ}}\left(c\right.$ 1.0, $\left.\mathrm{C}_{6} \mathrm{H}_{6}\right)$.

Suzuki Adduct 112. Bromopyrazine 73 ( $46.5 \mathrm{mg}, 0.087 \mathrm{mmol}$ ), boronic ester 97 ( $35 \mathrm{mg}, 0.058 \mathrm{mmol}$ ), benzene ( 1.15 mL ), methanol ( $231 \mu \mathrm{~L}$ ), 2 M aq. $\mathrm{Na}_{2} \mathrm{CO}_{3}(96 \mu \mathrm{~L})$, and tetrakis(triphenylphosphine)palladium( 0$)(6.7 \mathrm{mg}, 0.0058 \mathrm{mmol})$ were combined and deoxygenated by sparging with argon for 5 min . The reaction vessel was evacuated, purged with $\mathrm{N}_{2}$, sealed, heated to $50^{\circ} \mathrm{C}$ for 65 h , cooled to $23^{\circ} \mathrm{C}$, then quenched by the addition of $\mathrm{Na}_{2} \mathrm{SO}_{4}(200 \mathrm{mg})$. Following filtration over a pad of silica gel (2:1
hexanes:EtOAc eluent) and evaporation to dryness under reduced pressure, the remaining residue was purified by flash chromatography ( $3: 1$ hexanes:EtOAc) to afford Suzuki adduct 112 ( $41.5 \mathrm{mg}, 77 \%$ yield) as a yellow oil. $\mathrm{R}_{f} 0.43$ (2:1 hexanes: EtOAc ); ${ }^{1} \mathrm{H}$ NMR (300 MHz, $\mathrm{CDCl}_{3}$ ): $\delta 8.61(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.45(\mathrm{~s}, 1 \mathrm{H}), 8.44(\mathrm{~s}, 1 \mathrm{H}), 8.16(\mathrm{~d}, J=1.5$ $\mathrm{Hz}, 1 \mathrm{H}), 7.80(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.59(\mathrm{~s}, 1 \mathrm{H}), 7.40(\mathrm{dd}, J=8.5 \mathrm{~Hz}, 1.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.23(\mathrm{~d}$, $J=7.9 \mathrm{~Hz}, 2 \mathrm{H}), 5.85(\mathrm{~d}, J=10.0 \mathrm{~Hz}, 1 \mathrm{H}), 5.78(\mathrm{~d}, J=10.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.27-4.21(\mathrm{~m}, 1 \mathrm{H})$, $4.19(\mathrm{~s}, 3 \mathrm{H}), 3.72-3.59(\mathrm{~m}, 2 \mathrm{H}), 3.34(\mathrm{~s}, 3 \mathrm{H}), 3.13-3.02(\mathrm{~m}, 1 \mathrm{H}), 2.87-2.77(\mathrm{~m}, 1 \mathrm{H}), 2.32$ (s, 3H), 2.22-2.12 (m, 1H), 1.98-1.89 (m, 1H), 1.82-1.72 (m, 1H), 1.67 (app. t, $J=11.7$ $\mathrm{Hz}, 1 \mathrm{H}), 1.04-0.83(\mathrm{~m}, 2 \mathrm{H}), 0.78(\mathrm{~s}, 9 \mathrm{H}), 0.72(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 3 \mathrm{H}),-0.02(\mathrm{~s}, 9 \mathrm{H}),-0.09(\mathrm{~s}$, $3 \mathrm{H}),-0.16(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (75 MHz, $\left.\mathrm{CDCl}_{3,} 44 / 45 \mathrm{C}\right): \delta 190.0,156.2,145.7,143.6$, $136.9,135.7,135.5,135.0,132.7,130.3$ (2C), 130.2, 129.3, 128.8, 128.5, 127.3, 127.1 (2C), 125.3, 120.5, 119.0, 116.9, 116.4, 81.3, 77.2, 71.4, 66.7, 54.3, 51.6, 44.8, 41.8, 40.2, 34.8, 25.9 (3C), 21.8, 18.1, 16.1, -1.1 (3C), -4.0, -4.7; IR (film): 2952, 1660, 1555, 1372, 1372, 1190, 1140, $1089 \mathrm{~cm}^{-1} ; \quad \operatorname{HRMS}-\mathrm{FAB}(\mathrm{m} / \mathrm{z}):[\mathrm{M}]^{+}$calc'd for $\mathrm{C}_{45} \mathrm{H}_{59} \mathrm{~N}_{4} \mathrm{O}_{7} \mathrm{Si}_{2} \mathrm{SBr}$, 934.2826; found, 934.2829; $[\alpha]^{21}{ }_{\mathrm{D}}+51.73^{\circ}\left(c 1.0, \mathrm{CHCl}_{3}\right)$.

Ketone 113. Suzuki adduct 112 ( $113 \mathrm{mg}, 0.121 \mathrm{mmol}$ ), $\mathrm{LiBF}_{4}(113 \mathrm{mg}, 1.21$ $\mathrm{mmol})$, acetonitrile ( 6 mL ), and water ( $600 \mu \mathrm{~L}$ ) were heated to $45-50^{\circ} \mathrm{C}$. After 9 h , additional $\mathrm{LiBF}_{4}$ ( $30 \mathrm{mg}, 0.32 \mathrm{mmol}$ ) was introduced, and heating was continued. After 6 h , additional $\mathrm{LiBF}_{4}$ ( $35 \mathrm{mg}, 0.32 \mathrm{mmol}$ ) was introduced, and heating was continued for 16 h . The reaction mixture was cooled to $23^{\circ} \mathrm{C}$, quenched with $10 \%$ aq. citric acid (10 mL ), and extracted with EtOAc ( $3 \times 20 \mathrm{~mL}$ ). The combined organic layers were dried over $\mathrm{MgSO}_{4}$ and evaporated under reduced pressure. The crude product was purified by flash chromatography (3:1 EtOAc:hexanes) to yield alcohol $\mathbf{1 5 6}$ ( $96.9 \mathrm{mg}, \mathbf{9 8 \%}$ yield) as a yellow oil, which was used in the subsequent step without further purification. $\mathrm{R}_{f}=0.44$ (3:1 EtOAc:hexanes).

To alcohol $156(96 \mathrm{mg}, 0.117 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2.0 \mathrm{~mL})$ at $23^{\circ} \mathrm{C}$ was added Dess-Martin Periodinane ( $74.3 \mathrm{mg}, 0.175 \mathrm{mmol}$ ). The mixture was stirred for 3 min , quenched with a solution of saturated aq. $\mathrm{NaHCO}_{3}$ and saturated aq. $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}(1: 1,5 \mathrm{~mL})$, stirred for 5 min , and extracted with EtOAc ( $3 \times 15 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( 15 mL ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure. The crude product was purified by flash chromatography ( $1: 1$ hexanes:EtOAc) to yield ketone 113 ( $86 \mathrm{mg}, 90 \%$ yield) as a yellow foam. $\mathrm{R}_{f}=0.48$ (1:1
hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 8.61(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.45(\mathrm{~s}, 1 \mathrm{H})$, $8.42(\mathrm{~s}, 1 \mathrm{H}), 8.18(\mathrm{~d}, J=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.81(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.56(\mathrm{~s}, 1 \mathrm{H}), 7.42(\mathrm{dd}, J=$ $8.7 \mathrm{~Hz}, 1.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.25(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 2 \mathrm{H}), 5.77(\mathrm{~d}, J=10.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.72(\mathrm{~d}, J=10.2$ $\mathrm{Hz}, 1 \mathrm{H}), 4.62-4.56(\mathrm{~m}, 1 \mathrm{H}), 4.20(\mathrm{~s}, 3 \mathrm{H}), 3.57(\mathrm{app} . \mathrm{dt}, J=8.2 \mathrm{~Hz}, 1.8 \mathrm{~Hz}, 2 \mathrm{H}), 3.43(\mathrm{~s}$, $3 \mathrm{H}), 3.14-3.06(\mathrm{~m}, 1 \mathrm{H}), 2.91-2.81(\mathrm{~m}, 1 \mathrm{H}), 2.74(\mathrm{~s}, 2 \mathrm{H}), 2.40(\mathrm{dd}, J=12.5 \mathrm{~Hz}, 2.9 \mathrm{~Hz}$, $1 \mathrm{H}), 2.34(\mathrm{~s}, 3 \mathrm{H}), 0.96-0.88(\mathrm{~m}, 2 \mathrm{H}), 0.78(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}),-0.02(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}, 37 / 39 \mathrm{C}$ ): $\delta 207.2,188.0,156.1,145.7,143.2,136.3,135.7,134.9$, 132.6, 130.7, 130.3 (2C), 128.8, 128.4, 127.3, 127.1 (2C), 125.4, 120.5, 119.0, 116.8, $116.3,82.4,77.1,66.9,54.3,52.2,52.0,49.2,40.2,35.2,21.8,18.1,12.2,-1.2$ (3C); IR (film): 2950, 1716, 1664, 1557, 1373, 1190, 1178, $1090 \mathrm{~cm}^{-1}$; HRMS-FAB $(\mathrm{m} / \mathrm{z}):[\mathrm{M}]^{+}$ calc'd for $\mathrm{C}_{39} \mathrm{H}_{43} \mathrm{~N}_{4} \mathrm{O}_{7} \mathrm{SiSBr}$, 818.1805; found, 818.1836; $[\alpha]^{21}{ }_{\mathrm{D}}+71.61^{\circ}\left(c 1.0, \mathrm{CHCl}_{3}\right)$.

$\boldsymbol{\alpha}$-Bromoketone 117. To ketone $113(5.0 \mathrm{mg}, 0.0061 \mathrm{mmol})$ and triethylamine $(160 \mu \mathrm{~L}, 1.15 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added TMSOTf $(70 \mu \mathrm{~L}, 0.350 \mathrm{mmol})$ dropwise over 1 min . The reaction mixture was stirred for 30 min , quenched with saturated aq. $\mathrm{NaHCO}_{3}(2 \mathrm{~mL})$, and extracted with EtOAc ( $5 \times 1 \mathrm{~mL}$ ). The combined organic layers were washed with brine $(1.5 \mathrm{~mL})$ and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Evaporation of
the solvent under reduced pressure afforded silyl enol ether $\mathbf{1 1 5}$ as an unstable yellow oil that was used immediately in the subsequent reaction.

To crude silyl enol ether product $\mathbf{1 1 5}$ in THF ( 1.5 mL ) at $23^{\circ} \mathrm{C}$ was added freshly recrystallized NBS ( $14 \mathrm{mg}, 0.0786 \mathrm{mmol}$ ). The reaction mixture was stirred for 1 min , quenched with saturated aq. $\mathrm{NaHCO}_{3}(2 \mathrm{~mL})$, and extracted with EtOAc ( $5 \times 1 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( 1.5 mL ), dried by passage over a plug of silica gel (EtOAc eluent), and evaporated under reduced pressure to afford the crude product. Purification by preparative thin layer chromatography (1:1 hexanes:EtOAc eluent) afforded $\alpha$-bromoketone $117\left(5.3 \mathrm{mg}, 97 \%\right.$ yield, 2 steps) as a colorless oil. $\mathrm{R}_{f}$ 0.68 (1:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 9.01(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.87$ $(\mathrm{s}, 1 \mathrm{H}), 8.69(\mathrm{~s}, 1 \mathrm{H}), 8.15(\mathrm{~s}, 1 \mathrm{H}), 7.70(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.49(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.10$ (s, 1H), $6.40(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 5.45(\mathrm{~d}, J=10.2 \mathrm{~Hz}, 1 \mathrm{H}), 5.36(\mathrm{~d}, J=10.2 \mathrm{~Hz}, 1 \mathrm{H})$, $4.75(\mathrm{~s}, 1 \mathrm{H}), 4.14-4.06(\mathrm{~m}, 1 \mathrm{H}), 3.68(\mathrm{~s}, 3 \mathrm{H}), 3.60-3.46(\mathrm{comp} . \mathrm{m}, 3 \mathrm{H}), 3.44(\mathrm{~s}, 3 \mathrm{H})$, $2.64-2.55(\mathrm{~m}, 1 \mathrm{H}), 2.52-2.43(\mathrm{~m}, 1 \mathrm{H}), 1.58(\mathrm{~s}, 3 \mathrm{H}), 0.89(\mathrm{t}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 0.78(\mathrm{~d}, J=$ 6.6 Hz, 3H), -0.03 (s, 9H); ${ }^{13} \mathrm{C}$ NMR (125 MHz, C $\left.{ }_{6} \mathrm{D}_{6} 38 / 39 \mathrm{C}\right): ~ \delta 202.4,185.4,156.6$, $145.5,143.2,136.9,136.7,136.6,135.8,133.2,131.8,130.5$ (2C), 129.8, 129.4, 128.0, 127.3 (2C), 126.5, 121.0, 120.0, 117.7, 117.3, 82.9, 77.3, 67.0, 58.4, 54.1, 53.0, 43.4, 36.7, 35.0, 21.3, 18.4, 12.4, -1.0 (3C); IR (film): 2950, 1719, 1662, 1557, 1374, 1190, 1178, 1141, 1089; HRMS-FAB $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{39} \mathrm{H}_{43} \mathrm{Br}_{2} \mathrm{~N}_{4} \mathrm{O}_{7} \mathrm{SSi}$, 899.0968; found, 899.0952; $[\alpha]^{27}{ }_{D}+10.23^{\circ}\left(c 0.66, \mathrm{C}_{6} \mathrm{H}_{6}\right)$.

The relative stereochemistry of $\alpha$-bromoketone $\mathbf{1 1 7}$ was determined by NOE experiments. Medium strength NOE interactions were observed as indicated below. ${ }^{51}$

Favorskii product 118. To $\alpha$-bromoketone 117 ( $3.0 \mathrm{mg}, 0.0033 \mathrm{mmol}$ ) in THF $(1.0 \mathrm{~mL})$ at $23^{\circ} \mathrm{C}$ was added TBAF ( 1.0 M in THF, $20 \mu \mathrm{~L}, 0.020 \mathrm{mmol}$ ). The reaction mixture was stirred for 15 min , quenched with $10 \%(w / v)$ aq. citric acid ( 1 mL ), diluted with brine $(500 \mu \mathrm{~L})$, and extracted with $\operatorname{EtOAc}(5 \times 1 \mathrm{~mL})$. The combined organic layers were dried by passage over a plug of silica gel (EtOAc eluent, then $5: 1 \mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}$ eluent) and evaporated under reduced pressure to afford the crude product. Purification by preparative thin layer chromatography ( $5: 1 \mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}$ eluent) afforded Favorskii product $118\left(1.5 \mathrm{mg}, 66 \%\right.$ yield) as a yellow oil. $\mathrm{R}_{f} 0.53\left(5: 1 \mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}\right) ;{ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}$ ): $\delta 8.61(\mathrm{~d}, J=9.2 \mathrm{~Hz}, 1 \mathrm{H}), 8.59(\mathrm{~s}, 1 \mathrm{H}), 8.21(\mathrm{~s}, 1 \mathrm{H}), 7.97(\mathrm{~s}, 1 \mathrm{H})$, $7.60(\mathrm{~s}, 1 \mathrm{H}), 7.25(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 5.81(\mathrm{~d}, J=10.1 \mathrm{~Hz}, 1 \mathrm{H}), 5.76(\mathrm{~d}, J=10.1 \mathrm{~Hz}$, $1 \mathrm{H}), 4.96(\operatorname{app} . \mathrm{d}, J=3.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.24(\mathrm{~s}, 3 \mathrm{H}), 3.65(\mathrm{~m}, 2 \mathrm{H}), 3.42(\mathrm{~s}, 3 \mathrm{H}), 2.98(\mathrm{~d}, J=$

The relative stereochemistry of Favorskii product 118 was determined by NOE experiments. Medium strength NOE interactions were observed as indicated below. ${ }^{51}$

Tosyl Oxime 119. To ketone $113(50.0 \mathrm{mg}, 0.061 \mathrm{mmol}), \mathrm{NH}_{2} \mathrm{OH} \bullet \mathrm{HCl}(85 \mathrm{mg}$, 1.22 mmol ), and $\mathrm{NaOAc} \bullet 3 \mathrm{H}_{2} \mathrm{O}(125 \mathrm{mg}, 0.915 \mathrm{mmol})$ was added methanol ( 2.5 mL ),
followed by $\mathrm{H}_{2} \mathrm{O}(350 \mu \mathrm{~L})$, then additional methanol ( 5 mL ). The homogeneous solution was stirred at $23{ }^{\circ} \mathrm{C}$ for 8 h , and the solvent was removed under reduced pressure. $\mathrm{H}_{2} \mathrm{O}$ $(15 \mathrm{~mL})$ was added, and the resulting mixture was extracted with EtOAc ( $3 \times 15 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( 15 mL ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure. The crude product was further purified by filtration over a plug of silica gel (EtOAc eluent) to yield oxime 157 ( $50.1 \mathrm{mg}, 98 \%$ yield) as a yellow foam, which was used without purification in the subsequent reaction. $\mathrm{R}_{f}=0.46$ (1:1 hexanes:EtOAc).

To a solution of oxime 157 ( $20.0 \mathrm{mg}, 0.0240 \mathrm{mmol}$ ), $\mathrm{TsCl}(14.0 \mathrm{mg}, 0.0734$ $\mathrm{mmol})$, and $\mathrm{Bu}_{4} \mathrm{NBr}(1.0 \mathrm{mg}, 0.0031 \mathrm{mmol})$ in toluene $(2.0 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added $50 \%$ aq. $\mathrm{KOH}(310 \mu \mathrm{~L})$. The reaction mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 2 h , quenched with icecold $\mathrm{H}_{2} \mathrm{O}(1.5 \mathrm{~mL})$ and extracted with ice-cold EtOAc (5 x 1 mL ). The combined organic layers were washed with brine ( 1 mL ), dried by passage over a plug of silica gel (EtOAc eluent), and evaporated under reduced pressure. The crude product was purified by flash chromatography (1:1 hexanes:EtOAc) to yield tosyl oxime 119 ( $23.3 \mathrm{mg}, 98 \%$ yield) as a yellow foam. $\mathrm{R}_{f}=0.48\left(1: 1\right.$ hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 8.63(\mathrm{~d}, J=$ $8.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.46(\mathrm{~s}, 1 \mathrm{H}), 8.41(\mathrm{~s}, 1 \mathrm{H}), 8.19(\mathrm{~d}, J=1.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.81(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H})$, $7.65(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}), 7.51(\mathrm{~s}, 1 \mathrm{H}), 7.44(\mathrm{dd}, J=8.7 \mathrm{~Hz}, 1.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.28-7.19$ (comp. $\mathrm{m}, 4 \mathrm{H}), 5.87(\mathrm{~d}, J=10.2 \mathrm{~Hz}, 1 \mathrm{H}), 5.42(\mathrm{~d}, J=10.2 \mathrm{~Hz}, 1 \mathrm{H}), 4.45-4.43(\mathrm{~m}, 1 \mathrm{H}), 4.20(\mathrm{~s}$, $3 \mathrm{H})$, , $3.67-3.53$ (comp. m, 3H), $3.38(\mathrm{~s}, 3 \mathrm{H}), 2.98-2.89(\mathrm{~m}, 1 \mathrm{H}), 2.87-2.77(\mathrm{~m}, 1 \mathrm{H}), 2.42$ $(\mathrm{s}, 3 \mathrm{H}), 2.35(\mathrm{~s}, 3 \mathrm{H}), 2.12(\mathrm{~d}, J=14.0 \mathrm{~Hz}, 2 \mathrm{H}), 1.05-0.85(\mathrm{~m}, 2 \mathrm{H}), 0.78(\mathrm{~d}, J=6.6 \mathrm{~Hz}$, 3H), -0.02 (s, 9H); ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 187.2,165.8,156.3,145.8,144.8$, $143.5,135.8,135.7,135.3,135.0,132.9,132.6,130.4$ (2C), 129.9, 129.4 (2C), 129.1

Aminoketone 120. To a stirred solution of tosyl oxime 119 ( $23.3 \mathrm{mg}, 0.0236$ $\mathrm{mmol})$ in $\mathrm{EtOH}(3.5 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ was added $50 \%$ aq. $\mathrm{KOH}(450 \mu \mathrm{~L})$ dropwise over 1 min . The reaction mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 3 h , then 6 N aq. $\mathrm{HCl}(5 \mathrm{~mL})$ was added. The reaction mixture was heated to $60^{\circ} \mathrm{C}$ for 10 h , cooled to $23^{\circ} \mathrm{C}$, and purified by reversed-phase filtration through a Sep-Pak column: loaded with water containing $0.1 \%(w / v)$ TFA, washed with $15 \%$ acetonitrile:water containing $0.1 \%(w / v)$ TFA to remove salts, then $70 \%$ acetonitrile:water containing $0.1 \%(w / v)$ TFA to collect the crude product. The solvents were removed under reduced pressure to afford hemiaminal 123, which was used immediately in the subsequent reaction. Although hemiaminal $\mathbf{1 2 3}$ is typically used in crude form, it has been observed by ${ }^{1} \mathrm{H}$ NMR. ${ }^{1} \mathrm{H}$ NMR ( 600 MHz , $\left.\mathrm{CD}_{3} \mathrm{OD}\right): \delta 8.61(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 8.52(\mathrm{~s}, 1 \mathrm{H}), 8.24(\mathrm{~s}, 1 \mathrm{H}), 7.94(\mathrm{~s}, 1 \mathrm{H}), 7.60(\mathrm{~s}, 1 \mathrm{H})$, $7.25(\mathrm{~d}, J=9.2 \mathrm{~Hz}, 1 \mathrm{H}), 5.72(\mathrm{~d}, J=10.1 \mathrm{~Hz}, 1 \mathrm{H}), 5.65(\mathrm{~d}, J=10.1 \mathrm{~Hz}, 1 \mathrm{H}), 4.85-4.82$
$(\mathrm{m}, 1 \mathrm{H}), 4.49(\mathrm{~s}, 1 \mathrm{H}), 4.21(\mathrm{~s}, 3 \mathrm{H}), 3.47(\mathrm{~s}, 3 \mathrm{H}), 3.36-3.30(\mathrm{~m}, 1 \mathrm{H}), 3.26(\mathrm{dd}, J=12.8$, $2.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.61(\mathrm{dd}, J=12.8,2.7 \mathrm{~Hz}, 1 \mathrm{H}), 0.85(\mathrm{~d}, J=7.3 \mathrm{~Hz}, 3 \mathrm{H})$.

Hemiaminal 123 and $\mathrm{K}_{2} \mathrm{CO}_{3}(60 \mathrm{mg}, 0.434 \mathrm{mmol})$ in THF $(2 \mathrm{~mL})$ at $23{ }^{\circ} \mathrm{C}$ was added $\mathrm{H}_{2} \mathrm{O}(200 \mu \mathrm{~L})$. The reaction mixture was stirred for 10 min , then purified by reversed-phase filtration through a Sep-Pak column: loaded with water containing $0.1 \%$ $(w / v)$ TFA, washed with $10 \%$ acetonitrile:water containing $0.1 \%(w / v)$ TFA to remove salts, then $70 \%$ acetonitrile:water containing $0.1 \%(w / v)$ TFA to collect the crude product. After removal of solvents under reduced pressure, the crude material was further purified by reversed-phased HPLC. Concentration under reduced pressure provided aminoketone $\mathbf{1 2 0}\left(15.0 \mathrm{mg}, 96 \%\right.$ yield) as an orange/red oil. ${ }^{1} \mathrm{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}\right): \delta 8.60(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.53(\mathrm{~s}, 1 \mathrm{H}), 8.23(\mathrm{~s}, 1 \mathrm{H}), 7.81(\mathrm{~s}, 1 \mathrm{H}), 7.61$ $(\mathrm{d}, J=1.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.25(\mathrm{dd}, J=8.7 \mathrm{~Hz}, 1.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.82-4.78(\mathrm{~m}, 1 \mathrm{H}), 4.46(\mathrm{~s}, 1 \mathrm{H})$, $4.21(\mathrm{~s}, 3 \mathrm{H}), 3.47(\mathrm{~s}, 3 \mathrm{H}), 3.41-3.30(\mathrm{~m}, 1 \mathrm{H}), 3.26(\mathrm{dd}, J=12.9 \mathrm{~Hz}, 3.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.61$ $(\mathrm{dd}, J=12.9 \mathrm{~Hz}, 3.0 \mathrm{~Hz}, 1 \mathrm{H}), 0.88(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}$, 25/26 C): $\delta 203.5,183.3,156.8,142.4,139.9,139.1,136.3,133.4,130.7,129.9,129.6$, $126.9,125.5,124.5,123.1,116.9,115.4,112.6,84.3,66.0,54.5,52.9,40.4,36.6,12.2$; IR (film): 3156 (br), 2935, 1674, 1531, 1447, 1409, 1203, $1135 \mathrm{~cm}^{-1} ; \operatorname{HRMS}-\mathrm{FAB}(\mathrm{m} / \mathrm{z})$ : $[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{26} \mathrm{H}_{25} \mathrm{~N}_{5} \mathrm{O}_{4} \mathrm{Br}, 550.1090$; found, 550.1071; $[\alpha]^{20}{ }_{\mathrm{D}}+99.19^{\circ}$ (c 0.87, $\mathrm{MeOH})$.

The relative stereochemistry of deprotected aminoketone $\mathbf{1 2 0}$ was determined by NOE experiments. Medium strength NOE interactions were observed as indicated below. ${ }^{51}$ Analogous NOE interactions were observed for hemiaminal 123 and deprotected aminoketone 124.

120

Deprotected Aminoketone 124. To a stirred solution of aminoketone 120 (7.5 $\mathrm{mg}, 0.0113 \mathrm{mmol})$ in $\mathrm{MeCN}(1 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ was added TMSI ( $500 \mu \mathrm{~L}, 3.51 \mathrm{mmol}$ ) dropwise over 30 sec . The reaction mixture was heated to $60^{\circ} \mathrm{C}$ for 48 h , cooled to $0^{\circ} \mathrm{C}$, then transferred dropwise into a chilled solution $\left(0^{\circ} \mathrm{C}\right)$ of saturated aqueous sodium metabisulfite $(5 \mathrm{~mL})$. The mixture was diluted with $6 \mathrm{~N} \mathrm{HCl}(15 \mathrm{~mL})$, stirred at $0{ }^{\circ} \mathrm{C}$ for 20 min , then purified by reversed-phase filtration through a Sep-Pak column: loaded with water containing $0.1 \%(w / v)$ TFA, washed with $1 \mathrm{~N} \mathrm{HCl}, 10 \%$ acetonitrile:water containing $0.1 \%(w / v)$ TFA to remove salts, then $60 \%$ acetonitrile:water containing $0.1 \%$ $(w / v)$ TFA to collect the crude product. After removal of solvents under reduced
pressure, the crude material was further purified by reversed-phase HPLC. Concentration under reduced pressure provided deprotected aminoketone 124 ( 6.8 mg , $95 \%$ yield) as an orange/red oil. ${ }^{1} \mathrm{H}$ NMR ( $\left.300 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}\right)$ : $\delta 8.69(\mathrm{~s}, 1 \mathrm{H}), 8.59(\mathrm{~d}, J$ $=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.69(\mathrm{~s}, 1 \mathrm{H}), 7.61(\mathrm{~d}, J=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.57(\mathrm{~s}, 1 \mathrm{H}), 7.27(\mathrm{dd}, J=8.5 \mathrm{~Hz}$, $1.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.40(\mathrm{~s}, 1 \mathrm{H}), 4.06-3.98(\mathrm{~m}, 1 \mathrm{H}), 3.31-3.21(\mathrm{~m}, 1 \mathrm{H}), 2.87(\mathrm{dd}, J=13.2 \mathrm{~Hz}$, $3.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.79(\mathrm{dd}, J=13.1 \mathrm{~Hz}, 2.9 \mathrm{~Hz}, 1 \mathrm{H}), 0.85(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (75 $\left.\mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}, 23 / 24 \mathrm{C}\right): \delta 203.4,186.0,157.4,139.1,136.3,132.5,132.4,130.2,130.1$, $128.2,126.7,126.7,125.6,124.9,117.1,115.4,113.6,79.3,67.1,49.6,45.5,36.7,12.3 ;$ IR (film): 3164 (br), 2927, 1674, 1451, 1207, $1143 \mathrm{~cm}^{-1} ; \operatorname{HRMS-FAB}(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$ calc'd for $\mathrm{C}_{24} \mathrm{H}_{21} \mathrm{~N}_{5} \mathrm{O}_{4} \mathrm{Br}$, 522.0777; found, 522.0783; $[\alpha]^{22}{ }_{\mathrm{D}}+86.88^{\circ}(c 0.33, \mathrm{MeOH})$.

(+)-Dragmacidin F (7). To deprotected aminoketone $\mathbf{1 2 4}(3.6 \mathrm{mg}, 0.0056$ $\mathrm{mmol})$ and cyanamide ( $120 \mathrm{mg}, 2.86 \mathrm{mmol}$ ) in $\mathrm{H}_{2} \mathrm{O}(2 \mathrm{~mL}$, degassed by sparging with argon) at $23{ }^{\circ} \mathrm{C}$ was added $10 \%$ aq. $\mathrm{NaOH}(80 \mu \mathrm{~L})$. The reaction mixture was heated to $60^{\circ} \mathrm{C}$ for 2 h , cooled to $23^{\circ} \mathrm{C}$, then purified by reversed-phase filtration through a SepPak column: loaded with water containing $0.1 \%(w / v)$ TFA, washed with $10 \%$ acetonitrile:water containing $0.1 \%(w / v)$ TFA to remove salts, then $60 \%$ acetonitrile:water containing $0.1 \%(w / v)$ TFA to collect the crude product. After removal of solvents under reduced pressure, the product was further purified by reversed-phase HPLC. Concentration under reduced pressure afforded (+)-dragmacidin F (7, 3.2 mg,
$86 \%$ yield) as an orange/red oil. ${ }^{1} \mathrm{H}$ NMR ( $\left.600 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}\right): \delta 8.69(\mathrm{~s}, 1 \mathrm{H}), 8.59(\mathrm{~d}, J$ $=8.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.68(\mathrm{~s}, 1 \mathrm{H}), 7.60(\mathrm{~s}, 1 \mathrm{H}), 7.47(\mathrm{~s}, 1 \mathrm{H}), 7.26(\mathrm{~d}, J=8.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.12(\mathrm{br} \mathrm{s}$, $1 \mathrm{H}), 3.40-3.34(\mathrm{~m}, 1 \mathrm{H}), 2.73(\mathrm{dd}, J=12.0 \mathrm{~Hz}, 2.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.45(\mathrm{~d}, J=11.6 \mathrm{~Hz}, 1 \mathrm{H})$, $0.92(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}, 22 / 25 \mathrm{C}$ ): $\delta 188.5,157.5,149.6$, $139.1,132.6,132.4,128.5,128.4,126.7,126.2,125.6,124.9,124.8,123.3,117.1,115.4$, 113.7, 72.8, 45.3, 36.9, 33.3, 15.9; IR (film): 3175 (br), 2925, 1679, 1637, 1205, 1141 $\mathrm{cm}^{-1} ; \mathrm{UV}(\mathrm{MeOH}) \lambda_{\max } 283,389 \mathrm{~nm} ;$ HRMS-FAB $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{25} \mathrm{H}_{21} \mathrm{~N}_{7} \mathrm{O}_{3} \mathrm{Br}, 546.0889$; found, $546.0883 ;[\alpha]^{23}{ }_{\mathrm{D}}+146.21^{\circ}(c 0.45, \mathrm{MeOH})$.

Acetoxycyclohexene 128. A mixture of methyl ester 105 ( $50.0 \mathrm{mg}, 0.140 \mathrm{mmol}$ ) and $10 \% \mathrm{Pd} / \mathrm{C}(1.5 \mathrm{mg}, 0.0014 \mathrm{mmol})$ in $\mathrm{MeOH}(1.3 \mathrm{~mL})$ was stirred under an $\mathrm{H}_{2}$ atmosphere at $23^{\circ} \mathrm{C}$. After 35 min , the reaction mixture was filtered over a Celite plug (MeOH eluent), and the solvent was evaporated in vacuo. ${ }^{1} \mathrm{H}$ NMR integration showed that acetoxycyclohexene $\mathbf{1 2 8}$ was formed in approximately $10 \%$ yield.

Alternate Procedure. A mixture of methyl ester $\mathbf{1 0 5}$ ( $21.4 \mathrm{mg}, 0.06 \mathrm{mmol}$ ) and $10 \% \mathrm{Pd} / \mathrm{C}(0.3 \mathrm{mg}, 0.0003 \mathrm{mmol})$ in $\mathrm{MeOH}(1.5 \mathrm{~mL})$ was cooled to $0^{\circ} \mathrm{C}$. The reaction vessel was then evacuated and back-filled with $\mathrm{H}_{2}(4 \mathrm{x})$. After 1 h , the reaction mixture was filtered over a Celite plug (MeOH eluent), and the solvent was evaporated in vacuo. ${ }^{1}$ H NMR integration showed that acetoxycyclohexene $\mathbf{1 2 8}$ was formed in approximately $3 \%$ yield.

The stable chair conformer of methyl ester $\mathbf{1 0 5}$ was determined using homodecoupling NMR experiments. The coupling constant between $\mathrm{H}_{\mathrm{a}}$ and $\mathrm{H}_{\mathrm{b}}$ was measured as $J_{\mathrm{ab}}=10.7 \mathrm{~Hz}$.

An analytical sample of $\mathbf{1 0 5}$ was prepared via an alternate route as follows:

Acetoxycarbonate 158. To a solution of methyl ester $105(44.8 \mathrm{mg}, 0.12 \mathrm{mmol})$ in THF ( 2 mL ) was added TBAF ( 1.0 M in THF, $140 \mu \mathrm{~L}, 0.14 \mathrm{mmol}$ ). After 3 min of stirring, the reaction was quenched by the addition of saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}(2 \mathrm{~mL})$. EtOAc ( 4 mL ) was added, and the phases were partitioned. The aqueous phase was further extracted with EtOAc ( 2 x 2 mL ). The combined organic layers were successively washed with $\mathrm{H}_{2} \mathrm{O}(1 \mathrm{~mL})$ and brine ( 1 mL ), and dried over $\mathrm{MgSO}_{4}$. The solvent was evaporated in vacuo, and the residue was dissolved in toluene ( 4 mL ). $1,1^{\prime}$ 'carbonyldiimidazole $(82.1 \mathrm{mg}, 0.51 \mathrm{mmol})$ was added, and the mixture was heated at reflux for 2 h . After cooling to $23^{\circ} \mathrm{C}$, the crude reaction mixture was directly purified by flash column chromatography (3:2 hexanes:EtOAc eluent) to afford pure
acetoxycarbonate $\mathbf{1 5 8}$ ( 16.9 mg , $45 \%$ yield, 2 steps). $\mathrm{R}_{f} 0.15$ (1:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 5.70-5.62(\mathrm{~m}, 1 \mathrm{H}), 5.25($ app. d, $J=2.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.19$ (app. $\mathrm{d}, J=2.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.16(\mathrm{dd}, J=4.1,1.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.81(\mathrm{~s}, 3 \mathrm{H}), 2.84(\mathrm{ddd}, J=13.4,6.4$, $2.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.55-2.48(\mathrm{~m}, 1 \mathrm{H}), 2.32-2.26(\mathrm{~m}, 1 \mathrm{H}), 2.12(\mathrm{~s}, 3 \mathrm{H}), 1.96(\mathrm{dd}, J=13.3,11.1$ $\mathrm{Hz}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 169.3,168.3,146.6,140.2,113.7,81.6,79.5$, 66.4, 53.7, 39.3, 32.7, 20.9; IR (film) 1763 (br), 1230, $1180,1120 \mathrm{~cm}^{-1}$; HRMS-FAB $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{12} \mathrm{H}_{15} \mathrm{O}_{7}, 271.0818$; found, 271.0810; $[\alpha]^{25}{ }_{\mathrm{D}}-154.53^{\circ}$ (c 1.0, $\mathrm{C}_{6} \mathrm{H}_{6}$ ).

Acetoxycyclohexene 128. A mixture of acetoxycarbonate $\mathbf{1 5 8}$ ( $18.5 \mathrm{mg}, 0.07$ $\mathrm{mmol})$ and $10 \% \mathrm{Pd} / \mathrm{C}(1.4 \mathrm{mg}, 0.001 \mathrm{mmol})$ in $\mathrm{MeOH}(1.3 \mathrm{~mL})$ was cooled to $0^{\circ} \mathrm{C}$. The reaction vessel was then evacuated and back-filled with $\mathrm{H}_{2}(3 \mathrm{x})$. After 1 hr at $0^{\circ} \mathrm{C}$, the reaction mixture was filtered over a Celite plug ( MeOH eluent), and the solvent was evaporated in vacuo. The residue was purified by flash chromatography (1:1 EtOAc:hexanes eluent) to afford acetoxycyclohexene $\mathbf{1 2 8}(12.6 \mathrm{mg}, 81 \%$ yield) as a colorless oil. $\mathrm{R}_{f} 0.46$ (2:1 EtOAc:hexanes); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta$ 5.57-5.48 (comp. m, 2H), $3.77(\mathrm{~s}, 3 \mathrm{H}), 3.06(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 2.69-2.58(\mathrm{~m}, 1 \mathrm{H}), 2.29-2.20(\mathrm{~m}, 1 \mathrm{H}), 2.16-$ 1.91 (comp. m, 2H), $2.05(\mathrm{~s}, 3 \mathrm{H}), 1.69-1.66(\mathrm{~m}, 3 \mathrm{H}){ }^{13}{ }^{13} \mathrm{C}$ NR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 176.1,170.9,132.7,122.0,73.8,70.7,53.2,37.1,35.3,21.3,19.2$; IR (film) 3477 (br), 2953, 1736, $1239 \mathrm{~cm}^{-1}$; HRMS-FAB $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{11} \mathrm{H}_{17} \mathrm{O}_{5}$, 229.1076; found 229.1066; $[\alpha]^{25}{ }_{\mathrm{D}}-3.31^{\circ}\left(c 0.6, \mathrm{CHCl}_{3}\right)$.

Anti-diol 159. To 2-bromo SEM pyrrole (153, $4.66 \mathrm{~g}, 16.87 \mathrm{mmol})$ in THF (112 mL ) at $-78{ }^{\circ} \mathrm{C}$ was added $n-\mathrm{BuLi}(2.5 \mathrm{M}$ in hexanes, $6.04 \mathrm{~mL}, 15.09 \mathrm{mmol}$ ) dropwise over 1 min . After 7 min at $-78^{\circ} \mathrm{C}$, lactone $\mathbf{1 0 3}(1.26 \mathrm{~g}, 4.44 \mathrm{mmol})$ in THF ( 10 mL ) was added dropwise over 1 min . The reaction vessel was immediately warmed to $-42{ }^{\circ} \mathrm{C}$, stirred for 30 min , and cooled to $-78{ }^{\circ} \mathrm{C}$. The reaction mixture was quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}(50 \mathrm{~mL})$, then warmed to $23{ }^{\circ} \mathrm{C}$. The volatiles were removed under reduced pressure. The residue was partitioned between $\mathrm{Et}_{2} \mathrm{O}(125 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(100$ mL ), and the layers were separated. The aqueous layer was further extracted with $\mathrm{Et}_{2} \mathrm{O}$ ( $2 \times 125 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( 75 mL ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure. The crude product was purified by flash chromatography (4:1 hexanes:EtOAc eluent) to afford anti-diol 159 ( $1.84 \mathrm{~g}, 86 \%$ yield) as a pale yellow foam. $\mathrm{R}_{f} 0.48$ ( $2: 1$ hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 8.11$ (dd, $J=4.1,1.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.78($ app. t, $J=2.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.15(\mathrm{dd}, J=4.0,2.6 \mathrm{~Hz}, 1 \mathrm{H})$, $5.71(\mathrm{~d}, J=9.9 \mathrm{~Hz}, 1 \mathrm{H}), 5.58(\mathrm{~d}, J=10.2 \mathrm{~Hz}, 1 \mathrm{H}), 5.26(\mathrm{~s}, 1 \mathrm{H}), 5.17($ app. t, $J=1.8 \mathrm{~Hz}$, $1 \mathrm{H}), 4.92-4.82(\mathrm{~m}, 1 \mathrm{H}), 4.76-4.73(\mathrm{~m}, 1 \mathrm{H}), 4.45($ app. $\mathrm{t}, J=3.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.47(\mathrm{t}, J=7.7$ $\mathrm{Hz}, 2 \mathrm{H}), 2.66(\mathrm{ddd}, J=12.4,5.2,2.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.39(\mathrm{dd}, J=14.4,2.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.20(\mathrm{app}$. $\mathrm{dt}, J=8.7,4.8 \mathrm{~Hz}, 1 \mathrm{H}$ ), 1.92 (app. $\mathrm{t}, J=12.0 \mathrm{~Hz}, 1 \mathrm{H}$ ), $0.88-0.80$ (comp. m, 12 H ), -0.04 $(\mathrm{s}, 3 \mathrm{H}),-0.06(\mathrm{~s}, 3 \mathrm{H}),-0.06(\mathrm{~s}, 9 \mathrm{H}),{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 192.8,151.6,130.5$, $128.6,124.8,109.3,108.3,83.0,78.5,76.7,66.4,66.2,48.5,42.1,26.1$ (3C), 18.4, 18.4, 0.9 (3C), -4.4, -5.1; IR (film): 3456 (br), 2953, 1637, 1406, 1250, $1091 \mathrm{~cm}^{-1} ;$ HRMS-FAB
$(m / z):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{24} \mathrm{H}_{44} \mathrm{NO}_{5} \mathrm{Si}_{2}, 482.2758$; found, 482.2751; $[\alpha]^{28}{ }_{\mathrm{D}}-21.18^{\circ}(c$ 1.0, $\mathrm{C}_{6} \mathrm{H}_{6}$ ).

Bis(silylether) 131. To a solution of anti-diol 159 ( $253.1 \mathrm{mg}, 0.53 \mathrm{mmol}$ ), imidazole ( $147.1 \mathrm{mg}, 2.16 \mathrm{mmol}$ ), and DMAP ( $23.5 \mathrm{mg}, 0.19 \mathrm{mmol}$ ) in DMF ( 5.0 mL ), was added $\mathrm{TBSCl}(152.5 \mathrm{mg}, 1.01 \mathrm{mmol})$. The solution was warmed to $50{ }^{\circ} \mathrm{C}$ for 70 min , cooled to $0^{\circ} \mathrm{C}$, then quenched by the addition of $10 \%(w / v)$ aq. citric acid ( 10 mL ). $\mathrm{Et}_{2} \mathrm{O}(40 \mathrm{~mL})$ was added, and the layers were partitioned. The aqueous phase was further extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 30 \mathrm{~mL})$. The combined organic extracts were washed with brine ( 15 mL ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure. The crude product was purified by flash chromatography ( $9: 1$ hexanes:EtOAc eluent) to provide bis(silylether) $\mathbf{1 3 1}$ ( $296.0 \mathrm{mg}, 95 \%$ yield) as a colorless oil that solidified under reduced pressure. $\mathrm{R}_{f} 0.61$ (4:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 8.17$ (dd, $J=4.0$, $1.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.76(\mathrm{dd}, J=2.5,1.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.14(\mathrm{dd}, J=4.0,2.6 \mathrm{~Hz}, 1 \mathrm{H}), 5.68(\mathrm{~d}, J=9.9$ $\mathrm{Hz}, 1 \mathrm{H}), 5.62(\mathrm{~d}, J=10.2 \mathrm{~Hz}, 1 \mathrm{H}), 5.37(\mathrm{~s}, 1 \mathrm{H}), 5.32($ app. $\mathrm{t}, J=2.1 \mathrm{~Hz}, 1 \mathrm{H}), 5.22-5.14$ (m, 1H), 4.77 (app. t, $J=1.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.50$ (app. $\mathrm{t}, J=3.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.47(\mathrm{t}, J=7.8 \mathrm{~Hz}$, $2 \mathrm{H}), 2.82$ (ddd, $J=12.7,5.1,2.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.45(\mathrm{dd}, J=14.6,2.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.27-2.18$ (comp. m, 2H), $0.99(\mathrm{~s}, 9 \mathrm{H}), 0.88(\mathrm{~s}, 9 \mathrm{H}), 0.82(\mathrm{t}, J=7.8 \mathrm{~Hz}, 2 \mathrm{H}), 0.17(\mathrm{~s}, 3 \mathrm{H}), 0.14(\mathrm{~s}$, $3 \mathrm{H}), 0.00(\mathrm{~s}, 3 \mathrm{H}),-0.04(\mathrm{~s}, 3 \mathrm{H}),-0.07(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (75 MHz, $\left.\mathrm{C}_{6} \mathrm{D}_{6}, 29 / 30 \mathrm{C}\right): \delta$ $192.6,151.6,130.4,124.5,109.3,108.6,83.2,78.5,76.8,67.4,66.3,49.3,42.1,26.4$

The stable chair conformer of bis(silylether) 131 was determined using a combination of NOESY-1D, gCOSY, and homodecoupling NMR experiments. Medium strength NOE interactions were observed as indicated below. ${ }^{51}$ The coupling constant between $\mathrm{H}_{\mathrm{a}}$ and $\mathrm{H}_{\mathrm{b}}$ was measured as $J_{\mathrm{ab}}=11.0 \mathrm{~Hz}$.

Syn-diol 132. To bis(silylether) $\mathbf{1 3 1}$ ( $113.9 \mathrm{mg}, 0.19 \mathrm{mmol}$ ) in THF ( 10.0 mL ) was added TBAF ( 1.0 M in THF, $195 \mu \mathrm{~L}, 0.20 \mathrm{mmol}$ ) in a dropwise fashion over 1 min . The reaction mixture was stirred for 2 min , quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}(15 \mathrm{~mL})$, then poured into EtOAc $(40 \mathrm{~mL})$. The layers were partitioned, and the aqueous layer was further extracted with EtOAc ( 2 x 40 mL ). The combined organic extracts were successively washed with $\mathrm{H}_{2} \mathrm{O}(15 \mathrm{~mL})$ and brine ( 15 mL ), dried over $\mathrm{MgSO}_{4}$, and
evaporated under reduced pressure. The residue was purified by flash chromatography (7:1 hexanes:EtOAc eluent) to furnish syn diol $\mathbf{1 3 2}(87.5 \mathrm{mg}, 95 \%$ yield) as a pale yellow oil. $\mathrm{R}_{f} 0.29$ (4:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 7.09$ (dd, $J=4.1,1.4 \mathrm{~Hz}$, $1 \mathrm{H}), 6.63(\mathrm{dd}, J=2.3,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.89(\mathrm{dd}, J=4.1,2.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.51-5.39(\mathrm{comp} . \mathrm{m}$, $4 \mathrm{H}), 5.27-5.19(\mathrm{~m}, 1 \mathrm{H}), 5.01$ (app. t, $J=2.1 \mathrm{~Hz}, 1 \mathrm{H}), 4.52-4.46(\mathrm{~m}, 1 \mathrm{H}), 3.86(\mathrm{~d}, J=8.0$ $\mathrm{Hz}, 1 \mathrm{H}), 3.37$ (t, $J=7.7 \mathrm{~Hz}, 2 \mathrm{H}$ ), 2.45-2.23 (comp. m, 3H), 2.04 (app. dt, $J=8.4,4.9 \mathrm{~Hz}$, $1 \mathrm{H}), 0.99(\mathrm{~s}, 9 \mathrm{H}), 0.79(\mathrm{t}, J=7.8 \mathrm{~Hz}, 2 \mathrm{H}), 0.14(\mathrm{~s}, 3 \mathrm{H}), 0.11(\mathrm{~s}, 3 \mathrm{H}),-0.09(\mathrm{~s}, 9 \mathrm{H}),{ }^{13} \mathrm{C}$ NMR (75 MHz, $\left.\mathrm{C}_{6} \mathrm{D}_{6}\right): ~ \delta 191.6,152.9,131.4,126.4,124.0,109.8,108.5,81.2,78.8,74.7$, 67.4, 66.6, 49.0, 43.3, 26.4 (3C), 18.9, 18.3, -1.0 (3C), -4.5, -4.5; IR (film): 3363 (br), 2954, 1631, 1410, 1314, 1250, 1101 (br) $\mathrm{cm}^{-1}$; HRMS-FAB $(m / z):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{24} \mathrm{H}_{44} \mathrm{NO}_{5} \mathrm{Si}_{2}, 482.2758$; found, 482.2780; $[\alpha]^{27}{ }_{\mathrm{D}}-27.06^{\circ}\left(c 1.0, \mathrm{C}_{6} \mathrm{H}_{6}\right)$.

Carbonate 130. To syn diol $132(68.2 \mathrm{mg}, 0.14 \mathrm{mmol})$ and 1,1 'carbonyldiimidazole ( $37.0 \mathrm{mg}, 0.23 \mathrm{mmol}$ ) in THF ( 2.6 mL ) was added NaH ( $60 \%$ dispersion in mineral oil, $21.9 \mathrm{mg}, 0.55 \mathrm{mmol}$ ) in one portion. The reaction was stirred for 20 min at $23^{\circ} \mathrm{C}$, then quenched by addition of saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}(20 \mathrm{~mL})$. The reaction mixture was poured into $\mathrm{EtOAc}(30 \mathrm{~mL})$, the layers were partitioned, and the aqueous layer was further extracted with $\mathrm{EtOAc}(2 \times 30 \mathrm{~mL})$. The combined organic extracts were successively washed with $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL})$ and brine $(10 \mathrm{~mL})$, dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure. Purification of the residue by flash
chromatography (6:1 hexanes:EtOAc eluent) afforded carbonate $130(65.8 \mathrm{mg}, 92 \%$ yield) as a colorless oil. $\mathrm{R}_{f} 0.29$ (4:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 7.91$ (dd, $J=4.1,1.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.68(\mathrm{dd}, J=2.8,1.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.02(\mathrm{dd}, J=4.3,2.6 \mathrm{~Hz}, 1 \mathrm{H})$, $5.51(\mathrm{~d}, J=9.9 \mathrm{~Hz}, 1 \mathrm{H}), 5.43(\mathrm{~d}, J=9.9 \mathrm{~Hz}, 1 \mathrm{H}), 5.24(\mathrm{app} . \mathrm{t}, J=1.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.84-4.75$ (m, 1H), 4.69 (app. t, $J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.46(\mathrm{dd}, J=3.9,1.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.39(\mathrm{t}, J=7.7 \mathrm{~Hz}$, $2 \mathrm{H}), 2.78$ (ddd, $J=13.5,6.1,2.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.12-1.98$ (comp. m, 2H), 1.92-1.85 (m, 1H), $0.86(\mathrm{~s}, 9 \mathrm{H}), 0.81(\mathrm{t}, J=7.8 \mathrm{~Hz}, 2 \mathrm{H}),-0.07--0.08$ (comp. m, 12 H ), $-0.10(\mathrm{~s}, 3 \mathrm{H}),{ }^{13} \mathrm{C}$ NMR (75 MHz, $\mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 185.9,147.2,146.4,132.1,126.7,125.0,112.2,110.3,87.9$, $80.3,78.8,66.8,66.5,46.1,33.7,26.2$ (3C), 18.6, 18.3, -1.0 (3C), -4.7, -5.0; IR (film): 2954, 1764, 1641, 1413, 1354, 1251, 1173, $1089 \mathrm{~cm}^{-1} ; \operatorname{HRMS-FAB}(m / z):[\mathrm{M}+\mathrm{H}]^{+}$ calc'd for $\mathrm{C}_{25} \mathrm{H}_{42} \mathrm{NO}_{6} \mathrm{Si}_{2}, 508.2551$; found, 508.2560; $[\alpha]^{27}{ }_{\mathrm{D}}-54.78^{\circ}\left(c 1.0, \mathrm{C}_{6} \mathrm{H}_{6}\right)$.

Pyrrolocyclohexene 126. A mixture of carbonate 130 ( $40.0 \mathrm{mg}, 0.08 \mathrm{mmol}$ ) and $10 \% \mathrm{Pd} / \mathrm{C}(1.7 \mathrm{mg}, 0.002 \mathrm{mmol})$ in $\mathrm{MeOH}(1.0 \mathrm{~mL})$ was cooled to $0^{\circ} \mathrm{C}$. The reaction vessel was then evacuated and back-filled with $\mathrm{H}_{2}(3 \mathrm{x})$. After 1.75 hr at $0^{\circ} \mathrm{C}$, the reaction mixture was filtered over a Celite plug ( MeOH eluent), and the solvent was evaporated in vacuo. The residue was purified by flash chromatography (9:1 hexanes:EtOAc eluent) to afford pyrrolocyclohexene 126 ( $33.1 \mathrm{mg}, 90 \%$ yield) as a colorless oil. $\mathrm{R}_{f} 0.53$ (4:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 6.94$ (dd, $J=$ $4.1,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.64(\mathrm{dd}, J=2.6,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.89(\mathrm{dd}, J=4.0,2.6 \mathrm{~Hz}, 1 \mathrm{H}), 5.54(\mathrm{~d}, J$

[3.3.1] Bicycle 127. To pyrrolocyclohexene $126(40.0 \mathrm{mg}, 0.0859 \mathrm{mmol})$ was added $\operatorname{Pd}(\mathrm{OAc})_{2}(23.0 \mathrm{mg}, 0.103 \mathrm{mmol})$, $\mathrm{DMSO}(14.6 \mu \mathrm{~L}, 0.206 \mathrm{mmol}), t-\mathrm{BuOH}(6.9$ $\mathrm{mL})$, and $\mathrm{AcOH}(1.7 \mathrm{~mL})$. The mixture was heated to $60^{\circ} \mathrm{C}$ for 8 h , cooled to $23^{\circ} \mathrm{C}$, and filtered over a plug of silica gel ( $2: 1$ hexanes:EtOAc eluent). The solvent was evaporated, and the product was purified by flash chromatography on silica gel (8:1 hexanes:EtOAc eluent) to afford [3.3.1] bicycle $\mathbf{1 2 7}$ contaminated with a trace amount of pyrrolocyclohexene 126. Although this material was carried on to the subsequent step without further purification, an analytical sample of 127 was obtained by flash chromatography on silica gel (12:1 hexanes:EtOAc eluent) as a colorless oil. $\mathrm{R}_{f} 0.64$ (3:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 6.64(\mathrm{~d}, J=2.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.25(\mathrm{~d}, J=10.2$ $\mathrm{Hz}, 1 \mathrm{H}), 5.84(\mathrm{~d}, J=2.8 \mathrm{~Hz}, 1 \mathrm{H}), 5.07(\mathrm{~d}, J=9.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.79(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 4.66(\mathrm{br} \mathrm{s}$,

Reduced Bicycle 136. Methyl ether 133 ( $23 \mathrm{mg}, 0.0479 \mathrm{mmol}$ ), $10 \% \mathrm{Pd} / \mathrm{C}(15$ $\mathrm{mg}, 0.014 \mathrm{mmol})$, and $\mathrm{EtOAc}(2.5 \mathrm{~mL})$ were combined, and the reaction vessel was evacuated and back-filled with $\mathrm{H}_{2}(1 \mathrm{~atm})$. The reaction mixture was stirred under $\mathrm{H}_{2}$ for 5 min , then filtered over a plug of silica gel topped with Celite (EtOAc eluent) to afford reduced bicycle 136 as a colorless oil ( $23 \mathrm{mg}, 99 \%$ yield). $\mathrm{R}_{f} 0.28$ (5:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $6.64(\mathrm{~d}, J=2.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.52(\mathrm{~d}, J=10.2 \mathrm{~Hz}, 1 \mathrm{H}) 5.83(\mathrm{~d}, J$ $=2.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.05(\mathrm{~d}, J=10.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.71-3.51($ comp. $\mathrm{m}, 3 \mathrm{H}), 3.42(\mathrm{~s}, 3 \mathrm{H}), 2.78$ (app. dt, $J=7.4,3.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.60$ (app. q, $J=3.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.40$ (app. dt, $J=8.1,4.6 \mathrm{~Hz}$, $1 \mathrm{H}), 1.81(\mathrm{dd}, J=13.8,4.4 \mathrm{~Hz}, 1 \mathrm{H}), 1.58(\mathrm{dd}, J=11.4,2.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.42-1.53(\mathrm{~m}, 1 \mathrm{H})$, $0.99-0.81(\mathrm{~m}, 2 \mathrm{H}), 0.87(\mathrm{~d}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 0.72(\mathrm{~s}, 9 \mathrm{H}),-0.06(\mathrm{~s}, 9 \mathrm{H}),-0.10(\mathrm{~s}, 3 \mathrm{H}),-$ 0.21 (s, 3H); ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}, 24 / 25 \mathrm{C}$ ): $\delta 189.3,140.3,129.1,109.2,79.2,77.2$, $71.5,66.5,51.2,45.4,41.9,38.3,36.8,26.1$ (3C), 18.4, 18.4, 17.1, -1.0 (3C), -4.4, -5.0; IR (film): 2952, 1660, 1497, 1425, 1251, 1118, 1100, $1042 \mathrm{~cm}^{-1} ; \operatorname{HRMS}-\mathrm{FAB}(\mathrm{m} / \mathrm{z}):[\mathrm{M}$ $+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{25} \mathrm{H}_{46} \mathrm{NO}_{4} \mathrm{Si}_{2}, 480.2965$; found, 480.2955; $[\alpha]_{\mathrm{D}}^{25}+220.84^{\circ}\left(c 1.0, \mathrm{C}_{6} \mathrm{H}_{6}\right)$.

Pyrazine 134. To silyl ether $136(10.0 \mathrm{mg}, 0.0208 \mathrm{mmol})$ in THF $(2 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added freshly recrystallized NBS ( $4.8 \mathrm{mg}, 0.0271 \mathrm{mmol}$ ) in THF ( $200 \mu \mathrm{~L}$ ). After 10 $\min$ at $0^{\circ} \mathrm{C}$, the reaction mixture was warmed to $23^{\circ} \mathrm{C}$, stirred for 40 min , then cooled to $0{ }^{\circ} \mathrm{C}$. The reaction was quenched with saturated aq. $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}(1.5 \mathrm{~mL})$, diluted with $\mathrm{H}_{2} \mathrm{O}$ $(1 \mathrm{~mL})$, and extracted with $\operatorname{EtOAc}(5 \mathrm{x} 1 \mathrm{~mL})$. The combined organic layers were washed with brine ( 1 mL ), dried by passage over a plug of silica gel (EtOAc eluent), and evaporated under reduced pressure to afford the crude product. Further purification by preparative thin layer chromatography (4:1 hexanes:EtOAc eluent) afforded bromide 160 $\left(8.5 \mathrm{mg}, 73 \%\right.$ yield) as a colorless oil. $\mathrm{R}_{f} 0.4$ (5:1 hexanes:EtOAc).

To bromide 160 ( $12.7 \mathrm{mg}, 0.0227 \mathrm{mmol}$ ) and 2-isopropoxy-4,4,5,5-tetramethyl-1,3,2-dioxaborolane ( $\mathbf{6 9}, 190 \mu \mathrm{~L}, 0.932 \mathrm{mmol}$ ) in THF ( 2.3 mL ) at $-78^{\circ} \mathrm{C}$ was added $n$ BuLi (2.5 M in hexanes, $273 \mu \mathrm{~L}, 0.682 \mathrm{mmol}$ ) dropwise over 1 min . After stirring for 10 min at $-78{ }^{\circ} \mathrm{C}$, the reaction mixture was quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}(1.5 \mathrm{~mL})$, warmed to $23{ }^{\circ} \mathrm{C}$, diluted with $\mathrm{H}_{2} \mathrm{O}(1 \mathrm{~mL})$, and extracted with EtOAc ( $5 \times 1 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( 1 mL ), dried by passage over a plug of
silica gel (EtOAc eluent), and evaporated under reduced pressure to afford the crude product. Further purification by preparative thin layer chromatography (4:1 hexanes:EtOAc eluent) afforded boronic ester $\mathbf{1 6 1}(10.1 \mathrm{mg}, 73 \%$ yield) as a colorless oil. $\mathrm{R}_{f} 0.38$ (5:1 hexanes:EtOAc).

A vial charged with bromopyrazine 73 ( $12.4 \mathrm{mg}, 0.0231 \mathrm{mmol}$ ), boronic ester 161 ( $10.0 \mathrm{mg}, 0.0165 \mathrm{mmol}$ ), and tetrakis(triphenylphosphine)palladium(0) ( $2.9 \mathrm{mg}, 0.00248$ mmol) was evacuated and purged with $\mathrm{N}_{2}$. Deoxygenated benzene (330 $\mu \mathrm{L}$ ), deoxygenated methanol ( $65 \mu \mathrm{~L}$ ), and deoxygenated 2 M aq. $\mathrm{Na}_{2} \mathrm{CO}_{3}(28 \mu \mathrm{~L})$ were then added. The reaction vessel was sealed, heated to $50^{\circ} \mathrm{C}$ for 82 h , cooled to $23{ }^{\circ} \mathrm{C}$, then quenched by the addition of $\mathrm{Na}_{2} \mathrm{SO}_{4}(100 \mathrm{mg})$. Following filtration over a pad of silica gel (1:1 hexanes:EtOAc eluent) and evaporation to dryness under reduced pressure, the residue was purified by preparative thin layer chromatography (2:1 hexanes:EtOAc eluent) to afford pyrazine $\mathbf{1 3 4}$ ( $4.4 \mathrm{mg}, 28 \%$ yield) as a yellow foam. $\mathrm{R}_{f} 0.44$ (2:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 9.02(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}), 8.85(\mathrm{~s}, 1 \mathrm{H})$, $8.69(\mathrm{~d}, J=2.0 \mathrm{~Hz}, 1 \mathrm{H}), 8.35(\mathrm{~s}, 1 \mathrm{H}), 7.71-7.68(\mathrm{~m}, 2 \mathrm{H}), 7.48(\mathrm{dd}, J=8.8 \mathrm{~Hz}, 2.0 \mathrm{~Hz}$, $1 \mathrm{H}), 7.26(\mathrm{~s}, 1 \mathrm{H}), 6.57(\mathrm{~d}, J=10.3 \mathrm{~Hz}, 1 \mathrm{H}), 6.40(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 2 \mathrm{H}), 5.16(\mathrm{~d}, J=10.3$ $\mathrm{Hz}, 1 \mathrm{H}), 3.92$ (d, $J=3.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.74(\mathrm{~s}, 3 \mathrm{H}), 3.73-3.58$ (comp. m, 3H), 3.45 (s, 3H), 2.91 (app. dt, $J=7.3,3.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.44$ (app. t, $J=7.1 \mathrm{~Hz}, 1 \mathrm{H}$ ), 1.86 (dd, $J=13.9,4.2$ $\mathrm{Hz}, 1 \mathrm{H}), 1.74(\mathrm{dd}, J=11.7,2.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.64-1.55($ comp. m, 4H), 1.02-0.86 (m, 2H), $0.75(\mathrm{~s}, 9 \mathrm{H}), 0.68(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}),-0.05(\mathrm{~s}, 9 \mathrm{H}),-0.09(\mathrm{~s}, 3 \mathrm{H}),-0.23(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (125 MHz, $\mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 190.4,156.7,145.4,145.0,138.6,136.7,135.9,135.8,133.4,131.0$, 130.4 (2C), 129.5, 129.5, 129.1, 127.9, 127.4 (2C), 126.7, 120.8, 119.8, 118.0, 117.2, $79.0,77.8,72.1,67.1,53.9,51.4,45.4,41.7,39.8,34.6,26.2$ (3C), 21.3, 18.6, 18.5, 17.3,
-1.0 (3C), -4.4, -5.0; IR (film): 2951, 1661, 1556, 1376, 1250, 1178, 1141, 1090, 1011 $\mathrm{cm}^{-1}$; HRMS-FAB (m/z): $[\mathrm{M}]^{+}$calc'd for $\mathrm{C}_{45} \mathrm{H}_{59} \mathrm{BrN}_{4} \mathrm{O}_{7} \mathrm{SSi}_{2}, ~ 934.2826$; found, 934.2872; $[\alpha]^{20}{ }_{\mathrm{D}}-91.02^{\circ}\left(c 0.57, \mathrm{C}_{6} \mathrm{H}_{6}\right)$.

Ketone 138. To methyl ether 133 ( $120 \mathrm{mg}, 0.25 \mathrm{mmol}$ ) in THF ( 12.5 mL ) was added TBAF (1.0 M in THF, $750 \mu \mathrm{~L}, 0.75 \mathrm{mmol}$ ). The reaction mixture was stirred for 4 h, quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}(10 \mathrm{~mL})$, diluted with $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$, and extracted with EtOAc (3 x 25 mL ). The combined organic extracts were washed with brine (15 mL ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure. The residue was purified by flash chromatography (1:1 hexanes:EtOAc eluent) to furnish allylic alcohol 137 ( $86 \mathrm{mg}, 95 \%$ yield) as a pale yellow oil. $\mathrm{R}_{f} 0.12$ (2:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR (300 $\left.\mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}\right): \delta 6.60(\mathrm{~d}, J=2.8 \mathrm{~Hz}, 1 \mathrm{H}), 5.81(\mathrm{~d}, J=2.8 \mathrm{~Hz}, 1 \mathrm{H}), 5.64(\mathrm{~d}, J=10.2 \mathrm{~Hz}$, $1 \mathrm{H}), 5.58(\mathrm{~d}, J=10.2 \mathrm{~Hz}, 1 \mathrm{H}), 4.80(\mathrm{~d}, J=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.64(\mathrm{~d}, J=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.15-$ $4.09(\mathrm{~m}, 1 \mathrm{H}), 3.68-3.59(\mathrm{~m}, 2 \mathrm{H}), 3.42(\mathrm{t}, J=3.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.36(\mathrm{~s}, 3 \mathrm{H}), 2.72(\mathrm{app} . \mathrm{dt}, J=$ $7.4,3.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.58$ (app. dt, $J=8.1,4.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.89(\mathrm{dd}, J=14.2,5.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.65$ $(\mathrm{dd}, J=11.6,3.0 \mathrm{~Hz}, 1 \mathrm{H}), 0.97-0.88(\mathrm{~m}, 2 \mathrm{H}), 0.59(\mathrm{~d}, J=3.9 \mathrm{~Hz}, 1 \mathrm{H}),-0.03(\mathrm{~s}, 9 \mathrm{H}),{ }^{13} \mathrm{C}$ NMR (75 MHz, $\left.\mathrm{C}_{6} \mathrm{D}_{6}, 18 / 19 \mathrm{C}\right): \delta 189.4,149.4,140.6,130.4,113.8,107.4,78.9,76.7$, 72.0, 66.2, 51.6, 44.3, 41.1, 39.5, 18.4, -0.9 (3C); IR (film): 3460 (br), 2951, 1659, 1424,

1248, 1111, $1023 \mathrm{~cm}^{-1}$; HRMS-FAB $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{19} \mathrm{H}_{30} \mathrm{NO}_{4} \mathrm{Si}, 364.1944$; found, 364.1942; $[\alpha]^{24}{ }_{\mathrm{D}}+330.71^{\circ}\left(c 1.0, \mathrm{C}_{6} \mathrm{H}_{6}\right)$.

Allylic alcohol $137(44.0 \mathrm{mg}, \quad 0.121 \mathrm{mmol})$ and freshly prepared $\operatorname{Rh}(\mathrm{nbd})(\mathrm{dppb}) \mathrm{BF}_{4}(8.6 \mathrm{mg}, 0.0121 \mathrm{mmol})^{48}$ were combined under a glovebox atmosphere. The reaction vessel was carefully sealed and removed from the glovebox. $\mathrm{CH}_{2} \mathrm{Cl}_{2}(12.0 \mathrm{~mL})$ was added, and a balloon of $\mathrm{H}_{2}(1 \mathrm{~atm})$ was applied without purging. After 3 h of stirring, the reaction mixture was filtered over a plug of silica gel $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$, then 2:1 hexanes:EtOAc eluent) to afford ketone $\mathbf{1 3 8}(43.0 \mathrm{mg}, \mathbf{9 8 \%}$ yield) as a colorless oil.

Alternate Procedure. To allylic alcohol $137(10.6 \mathrm{mg}, 0.029 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ $(1.5 \mathrm{~mL})$ at $23^{\circ} \mathrm{C}$ was added Dess-Martin periodinane ( $50.0 \mathrm{mg}, 0.118 \mathrm{mmol}$ ). The mixture was stirred for 10 min , quenched with a solution of saturated aq. $\mathrm{NaHCO}_{3}$ and saturated aq. $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}(1: 1,2 \mathrm{~mL})$, stirred for 10 min , and extracted with EtOAc (4 x 1 $\mathrm{mL})$. The combined organic layers were washed with brine ( 1 mL ), dried by passage over a plug of silica gel (EtOAc eluent), and evaporated under reduced pressure to afford the crude oxidized product, which was used in the subsequent reaction. $\mathrm{R}_{f} 0.31$ (2:1, hexanes:EtOAc).

A flask containing the crude oxidized product and $10 \% \mathrm{Pd} / \mathrm{C}(10 \mathrm{mg}, 0.0094$ mmol) in EtOH ( 2.0 mL ) at $23^{\circ} \mathrm{C}$ was evacuated and back-filled with $\mathrm{H}_{2}(3 \mathrm{x})$. After 20 min, the reaction mixture was filtered over a Celite plug (EtOAc eluent), and the solvent was evaporated in vacuo. The residue was dissolved in EtOAc ( 2 mL ), and then filtered over a short plug of silica gel (EtOAc eluent). After evaporation of solvent under reduced pressure, the crude material was further purified by preparative thin layer
chromatography ( $2: 1$ hexanes:EtOAc) to afford ketone $\mathbf{1 3 8}$ ( $9.9 \mathrm{mg}, 93 \%$ yield, 2 steps) as a colorless oil. $\mathrm{R}_{f} 0.30\left(2: 1\right.$ hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 6.53(\mathrm{~d}, J$ $=2.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.66(\mathrm{~d}, J=2.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.50(\mathrm{~d}, J=10.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.36(\mathrm{~d}, J=10.2 \mathrm{~Hz}$, $1 \mathrm{H}), 3.57-3.38(\mathrm{~m}, 2 \mathrm{H}), 3.34(\mathrm{~s}, 3 \mathrm{H}), 2.98(\mathrm{dd}, J=14.3,2.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.70-2.64(\mathrm{~m}, 1 \mathrm{H})$, 2.57-2.47 (m, 1H), $2.43(\mathrm{~d}, J=14.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.11-1.99(\mathrm{~m}, 1 \mathrm{H}), 1.69(\mathrm{dd}, J=12.2,2.6$ $\mathrm{Hz}, 1 \mathrm{H}), 0.95(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}), 0.84(\mathrm{t}, J=8.0 \mathrm{~Hz}, 2 \mathrm{H}),-0.03(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (125 $\mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ : $\delta$ 205.7, 187.9, 137.5, 131.1, 126.6, 109.7, 82.9, 76.8, 66.4, 52.7, 52.3, 48.1, $41.0,37.7,18.3,13.0,-1.0$ (3C); IR (film): 2952, 2931, 1716, 1660, 1421, 1123, 1097, $1076 \mathrm{~cm}^{-1}$; HRMS-FAB $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}-\mathrm{H}_{2}$ calc'd for $\mathrm{C}_{19} \mathrm{H}_{28} \mathrm{NO}_{4} \mathrm{Si}, 362.1788$; found, $362.1778 ;[\alpha]^{27}{ }_{\mathrm{D}}+163.23^{\circ}\left(c 1.0, \mathrm{C}_{6} \mathrm{H}_{6}\right)$.

Allylic Alcohol 139. To [3.3.1] bicycle 98 ( $45 \mathrm{mg}, 0.097 \mathrm{mmol}$ ) in THF ( 3 mL ) at $23^{\circ} \mathrm{C}$ was added NaH ( $60 \%$ dispersion in mineral oil, $40 \mathrm{mg}, 1.0 \mathrm{mmol}$ ). After stirring for 2 min at $23{ }^{\circ} \mathrm{C}$, MeI was added ( $335 \mu \mathrm{~L}, 1.6 \mathrm{mmol}$ ). The resulting mixture was stirred for 1 h , and then quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}(3 \mathrm{~mL})$. EtOAc ( 3 mL ) and $\mathrm{H}_{2} \mathrm{O}(3 \mathrm{~mL})$ were added, and the layers were separated. The aqueous layer was further extracted with EtOAc ( $3 \times 4 \mathrm{~mL}$ ). The combined organic layers were washed with brine $(4 \mathrm{~mL})$, dried by passage over a plug of $\mathrm{SiO}_{2}$ (EtOAc eluent), and evaporated under reduced pressure. The crude product was purified by flash chromatography (7:1
hexanes:EtOAc) to afford methyl ether $\mathbf{1 6 2}\left(40 \mathrm{mg}, 86 \%\right.$ yield) as a colorless oil. $\mathrm{R}_{f} 0.38$ (5:1 hexanes:EtOAc).

To methyl ether $\mathbf{1 6 2}$ ( $19 \mathrm{mg}, 0.0396 \mathrm{mmol}$ ) in THF ( 1.5 mL ) was added TBAF (1.0 M in $\mathrm{THF}, 75 \mu \mathrm{~L}, 0.075 \mathrm{mmol}$ ). The reaction mixture was stirred for 45 min , quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}(1 \mathrm{~mL})$, diluted with $\mathrm{H}_{2} \mathrm{O}(1 \mathrm{~mL})$, and extracted with $\operatorname{EtOAc}(5 \times 1 \mathrm{~mL})$. The combined organic extracts were washed with brine ( 1 mL ), dried by passage over a plug of $\mathrm{SiO}_{2}$ (EtOAc eluent), and evaporated under reduced pressure. The residue was purified by flash chromatography (1:1 hexanes:EtOAc eluent) to furnish allylic alcohol 139 ( $12.4 \mathrm{mg}, 86 \%$ yield) as a pale yellow oil. $\mathrm{R}_{f} 0.16$ (2:1 hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 6.57(\mathrm{~d}, J=2.4 \mathrm{~Hz}, 1 \mathrm{H}), 5.82(\mathrm{~d}, J=2.4$ $\mathrm{Hz}, 1 \mathrm{H}), 5.58(\mathrm{~d}, J=10.1 \mathrm{~Hz}, 1 \mathrm{H}), 5.49(\mathrm{~d}, J=10.1 \mathrm{~Hz}, 1 \mathrm{H}), 5.23-5.18(\mathrm{~m}, 1 \mathrm{H}), 5.00-$ $4.95(\mathrm{~m}, 1 \mathrm{H}), 4.03-3.90(\mathrm{~m}, 1 \mathrm{H}), 3.60-3.51(\mathrm{comp} . \mathrm{m}, 3 \mathrm{H}), 3.32(\mathrm{~s}, 3 \mathrm{H}), 2.61-2.50$ (comp. m, 2H), 1.73-1.61 (comp. m, 2H), 1.15 (br s, 1H), 0.87 (t, $J=8.0 \mathrm{~Hz}, 2 \mathrm{H}$ ), -0.07 (s, 9H); ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}, 18 / 19 \mathrm{C}$ ): $\delta 189.2,150.1,139.9,131.0,107.9,106.6$, 81.4, 77.0, 67.0, 66.5, 52.0, 46.3, 41.7, 40.9, 18.3, -1.0 (3C); IR (film): 3452 (br), 2951, 1653, 1420, 1250, 1125, $1076 \mathrm{~cm}^{-1}$; HRMS-EI ( $\mathrm{m} / \mathrm{z}$ ): $[\mathrm{M}]^{+}$calc'd for $\mathrm{C}_{19} \mathrm{H}_{29} \mathrm{NO}_{4} \mathrm{Si}$, 363.1866; found, 363.1857; $[\alpha]^{23}{ }_{\mathrm{D}}-410.29^{\circ}\left(c 1.0, \mathrm{C}_{6} \mathrm{H}_{6}\right)$.

Boronic Ester 144. A flask wrapped in aluminum foil at $23^{\circ} \mathrm{C}$ was charged with ketone $\mathbf{1 3 8}(25 \mathrm{mg}, 0.0689 \mathrm{mmol})$, THF ( 5 mL ), and freshly recrystallized NBS (37.5 $\mathrm{mg}, 0.211 \mathrm{mmol})$. The reaction vessel was placed in a $40^{\circ} \mathrm{C}$ oil bath, stirred for 15 min , then cooled to $0{ }^{\circ} \mathrm{C}$. The reaction was quenched with saturated aq. $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}(10 \mathrm{~mL})$, diluted with $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$, and extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 20 \mathrm{~mL})$. The combined organic layers were washed with brine ( 15 mL ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure to afford the crude product. Further purification by flash column chromatography (3:1 hexanes:EtOAc eluent) afforded bromide 163 ( $29.9 \mathrm{mg}, \mathbf{9 8 \%}$ yield) as a colorless oil. $\mathrm{R}_{f} 0.45$ (2:1 hexanes:EtOAc).

To bromide 163 ( $27 \mathrm{mg}, 0.061 \mathrm{mmol}$ ) and 2-isopropoxy-4,4,5,5-tetramethyl-1,3,2-dioxaborolane ( $69,510 \mu \mathrm{~L}, 2.5 \mathrm{mmol}$ ) in THF $(7 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$ was added $n-\mathrm{BuLi}$ (2.5 M in hexanes, $730 \mu \mathrm{~L}, 0.183 \mathrm{mmol}$ ) dropwise over 3 min . After stirring for an additional 10 min at $-78{ }^{\circ} \mathrm{C}$, the reaction mixture was quenched with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}$ ( 7 mL ), warmed to $23^{\circ} \mathrm{C}$, diluted with $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL}$ ), and extracted with EtOAc (3 x 20 mL ). The combined organic layers were washed with brine ( 15 mL ), dried over $\mathrm{MgSO}_{4}$ and evaporated under reduced pressure to afford the crude product. Further purification by flash column chromatography (3:1 hexanes:EtOAc eluent) afforded boronic ester 144 ( $22 \mathrm{mg}, 74 \%$ yield) as a colorless oil. $\mathrm{R}_{f} 0.42$ ( $2: 1$ hexanes:EtOAc); ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , $\left.\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta 7.37(\mathrm{~s}, 1 \mathrm{H}), 5.46(\mathrm{~d}, J=10.2 \mathrm{~Hz}, 1 \mathrm{H}), 5.33(\mathrm{~d}, J=10.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.77-3.72(\mathrm{~m}$,
$1 \mathrm{H}), 3.49-3.38(\mathrm{~m}, 2 \mathrm{H}), 3.31(\mathrm{~s}, 3 \mathrm{H}), 3.03(\mathrm{dd}, J=14.0,2.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.61-2.53(\mathrm{~m}, 1 \mathrm{H})$, $2.47(\mathrm{~d}, J=13.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.36-2.25(\mathrm{~m}, 1 \mathrm{H}), 1.78(\mathrm{dd}, J=12.4,3.0 \mathrm{~Hz}, 1 \mathrm{H}), 1.24(\mathrm{~d}, J=$ $6.6 \mathrm{~Hz}, 3 \mathrm{H}), 1.12(\mathrm{~s}, 12 \mathrm{H}), 0.84-0.77(\mathrm{~m}, 2 \mathrm{H}),-0.05(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$, 23/25 C): $\delta 206.4,188.3,144.6,140.0,83.6$ (2C), 83.1, 77.1, 66.5, 52.9, 52.3, 49.0, 41.4, 37.1, 25.3 (2C), 25.2 (2C), 18.3, 13.0, -0.9 (3C); IR (film) 2977, 2951, 1718, 1664, 1543, 1399, 1322, 1263, 1145, 1092, 1074; HRMS-FAB $(m / z):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{25} \mathrm{H}_{41} \mathrm{NO}_{6} \mathrm{SiB}, 490.2796$; found, 490.2800; $[\alpha]^{29}{ }_{\mathrm{D}}+50.77^{\circ}\left(c 0.4, \mathrm{C}_{6} \mathrm{H}_{6}\right)$.

(89\% yield)

Pyrazine (-)-113. A vial charged with bromopyrazine $73(29.6 \mathrm{mg}, 0.055$ mmol), boronic ester $\mathbf{1 4 4}(18 \mathrm{mg}$, 0.0368 mmol$)$, and tetrakis(triphenylphosphine)palladium(0) ( $6.4 \mathrm{mg}, 0.0055 \mathrm{mmol}$ ) was evacuated and purged with $\mathrm{N}_{2}$. Deoxygenated benzene $(735 \mu \mathrm{~L})$, deoxygenated methanol $(150 \mu \mathrm{~L})$, and deoxygenated 2 M aq. $\mathrm{Na}_{2} \mathrm{CO}_{3}(61 \mu \mathrm{~L})$ were then added. The reaction vessel was sealed, heated to $50^{\circ} \mathrm{C}$ for 72 h , cooled to $23{ }^{\circ} \mathrm{C}$, then quenched by the addition of $\mathrm{Na}_{2} \mathrm{SO}_{4}(200$ mg ). Following filtration over a pad of silica gel (3:1 EtOAc:hexanes eluent) and evaporation to dryness under reduced pressure, the residue was purified by flash column chromatography ( $2: 1 \rightarrow 1: 1$ hexanes:EtOAc eluent) to afford pyrazine ( - )-113 ( 26.8 mg , $89 \%$ yield) as a yellow foam. $\mathrm{R}_{f},{ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, HRMS, and IR characterization data for (+)-113 are reported earlier in this section. $[\alpha]^{27}{ }_{\mathrm{D}}-72.92^{\circ}\left(c \quad 1.0, \mathrm{CHCl}_{3}\right)$.

(-)-Dragmacidin F (7). Pyrazine (-)-113 was converted to (-)-dragmacidin F (7) by methods described earlier in this section. ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, HRMS, and IR characterization data for (+)-7 are also reported above. $[\alpha]^{29}{ }_{\mathrm{D}}-148.33^{\circ}(c 0.20, \mathrm{MeOH})$. For comparison, natural (-)-dragmacidin $\mathrm{F}(7):[\alpha]_{\mathrm{D}}^{25}-159^{\circ}(c 0.40, \mathrm{MeOH}) .{ }^{1 \mathrm{~b}}$

(12) Under certain conditions, we were able to produce $\mathbf{1 0 8}$ as a mixture of diastereomers. However, upon exposure of $\mathbf{1 0 8}$ to $\mathrm{Pd} / \mathrm{C}$ and $\mathrm{H}_{2}$ in MeOH , no reaction took place.
(13) Treatment of $\mathbf{1 0 5}$ under a variety of standard homogeneous $\pi$-allyl reduction conditions ${ }^{8}$ led to the formation of $\mathbf{1 0 6}, \mathbf{1 0 7}$, and $\mathbf{x}$, all of which presumably arise from loss of $\mathrm{OAc}^{-}$. In stark contrast, exposure of $\mathbf{1 0 5}$ to heterogeneous reductive isomerization conditions did not produce any of these compounds (see Scheme 3.4.2).

## APPENDIX FIVE

## The Formal Total Synthesis of Dragmacidin B, trans-Dragmacidin C, and cis- and trans-Dihydrohamacanthin A

## A5.1 Introduction

Having established that halogen-selective Suzuki couplings are a powerful method for constructing the carbon skeleton of the pyrazinone containing dragmacidins, we hypothesized that a similar strategy could be used to access the piperazine dragmacidins and related bis(indole) alkaloids. This appendix section describes the implementation of this approach to achieve the formal total synthesis of dragmacidin B (3), ${ }^{1}$ trans-dragmacidin $\mathrm{C}(\mathbf{4}),{ }^{2}$ and cis- and trans-dihydrohamacanthin $\mathrm{A}(\mathbf{1 6 4 b})^{3}$ (Figure A5.1.1). ${ }^{4}$

$R_{1}=B r, R_{2}=H$ (164c)
$R_{1}=R_{2}=\operatorname{Br}$ (164d)

## A5.2 The Formal Total Synthesis of Dragmacidin B and trans-Dragmacidin C

A retrosynthetic strategy for the preparation of dragmacidin B (3) and transdragmacidin C (4) is shown below in Scheme A5.2.1. Based on conditions reported by Horne, each of the bis(indole) alkaloids can be accessed from unsaturated derivative 165 in a single step. ${ }^{5}$ Pyrazine 165, in turn, would be obtained from two halogen-selective Suzuki cross-coupling reactions of boronic acid 166 with a dihalogenated pyrazine (167). We anticipated that the boronic acid fragment employed in our synthesis of dragmacidin D (i.e., 54b) could be utilized as a surrogate for 166 in order to achieve our current goals. However, the success of our plan would depend highly on the choice of halogens for pyrazine 167.

Scheme A5.2.1

In order to probe the limits of our halogen-selective Suzuki cross-coupling methodology, we chose to use known dibromide $\mathbf{1 6 8}^{6}$ as the critical pyrazine fragment (Scheme A5.2.2). In a one-pot, 4-step transformation, an excess of 6-bromoindolylboronic acid (54b) was exposed to dibromopyrazine 168 under our standard crosscoupling conditions. Following quenching with $\mathrm{KOH} /$ ethanol, the deprotected pyrazine product (165) was obtained in $54 \%$ yield. Notably, although four bromides were introduced in the reaction mixture, only the two pyrazinyl bromides were reactive in the presence of $\operatorname{Pd}(0)$ at $50^{\circ} \mathrm{C}$. This rapid synthesis of bis(indole)pyrazine $\mathbf{1 6 5}$ constitutes a formal total synthesis of both dragmacidin B (3) and trans-dragmacidin C (4). ${ }^{5,7,8}$

Scheme A5.2.2

## A5.3 The Formal Total Synthesis of cis- and trans-Dihydrohamacanthin A

These halogen-selective Suzuki couplings also have great potential for assembling a related family of natural products, the dihydrohamacanthins (164 and 169, Scheme A5.3.1). In this scenario, the desired alkaloids (164 and 169) would be obtained from their pyrazinone counterparts ( $\mathbf{2 2}$ and $\mathbf{1 7 0}$ ), using the method established by Horne. ${ }^{9}$ Intermediates 22 and 170, in turn, would arise via cross-coupling chemistry using indole fragments 171 and 172, as well as pyrazine fragments 173 and $\mathbf{1 7 4}$, in a manner similar to that described above. Halogen-selective cross-couplings will be crucial to prepare all of the halogenation patterns present in this series of natural products (164a-d, 169a-d).

Scheme A5.3.1

To demonstrate the feasibility of this approach, we prepared one of the dihydrohamacanthin natural products (164b, Scheme A5.3.2). In the first Suzuki coupling, dihalopyrazine $\mathbf{6 3}$ and bromoindole 54b were treated with $\operatorname{Pd}(0)$ at $23{ }^{\circ} \mathrm{C}$ to afford coupled indolylpyrazine 73, as described in Chapter 2, Section 2.3.4. Dibromide 73, in turn, was subjected to boronic ester 175 in the presence of $\operatorname{Pd}(0)$ at $50{ }^{\circ} \mathrm{C}$ to produce bis(indole)pyrazine $\mathbf{1 7 6}$ in $53 \%$ yield. In both cases, complete halogenselectivity was observed. Subsequent removal of all protecting groups furnished pyrazinone 22b, which has previously been converted to the natural product (164b) in a single step. ${ }^{9,10,11}$

Scheme A5.3.2

1. TBAF, THF $60^{\circ} \mathrm{C}$
2. Lil, collidine, $130^{\circ} \mathrm{C}$
(61\% yield)

## A5.4 Conclusion

In summary, we have completed the formal total synthesis of dragmacidin B (3) and trans-dragmacidin C (4). Our route features a one-pot, 4-step halogen-selective cross-coupling/deprotection sequence to construct the bis(indole) scaffold of our targets. In addition, we have applied this methodology to the formal synthesis of a dihydrohamacanthin natural product (164b).

## A5.5 Experimental Section

## A5.5.1 Materials and Methods

Unless stated otherwise, reactions were conducted in flame-dried glassware under an atmosphere of nitrogen using anhydrous solvents (either freshly distilled or passed through activated alumina columns). All commercially obtained reagents were used as received. Reaction temperatures were controlled using an IKAmag temperature modulator. Thin-layer chromatography (TLC) was conducted with E. Merck silica gel 60 F254 pre-coated plates $(0.25 \mathrm{~mm})$ and visualized using a combination of UV, anisaldehyde, and potassium permanganate staining. ICN silica gel (particle size 0.0320.063 mm ) was used for flash column chromatography.

## A5.5.2 Preparative Procedures

Bis(indole)pyrazine 165. A vial charged with dibromopyrazine $\mathbf{1 6 8}^{6}$ ( 15.1 mg , $0.0635 \mathrm{mmol})$, boronic acid $\mathbf{5 4 b}(75 \mathrm{mg}, 0.190 \mathrm{mmol})$, and tetrakis(triphenylphosphine)palladium(0) (11 mg, 0.0095 mmol ) was evacuated and purged with $\mathrm{N}_{2}$. Deoxygenated benzene ( 1.2 mL ), deoxygenated methanol ( $250 \mu \mathrm{~L}$ ), and deoxygenated 2 M aq. $\mathrm{Na}_{2} \mathrm{CO}_{3}(105 \mu \mathrm{~L})$ were added. The reaction mixture was sparged with argon for 3 min . The vial was then sealed, heated to $50^{\circ} \mathrm{C}$ for 84 h , and cooled to $23{ }^{\circ} \mathrm{C}$. $\mathrm{EtOH}(7 \mathrm{~mL})$ and $\mathrm{KOH}(500 \mathrm{mg})$ were added. The reaction mixture was heated
to $50^{\circ} \mathrm{C}$ for 20 h , cooled to $23^{\circ} \mathrm{C}$, then quenched by pouring into $10 \%(w / v)$ aq. citric acid $(20 \mathrm{~mL}) . \operatorname{EtOAc}(30 \mathrm{~mL})$ was added, and the layers were partitioned. The aqueous phase was further extracted with EtOAc ( $2 \times 30 \mathrm{~mL}$ ). The combined organic layers were washed with brine ( 15 mL ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure. The crude product was purified by flash chromatography ( $10: 1 \mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}$ eluent $)$, then further purified by preparative thin layer chromatography (2:1 EtOAc:hexanes eluent) to afford known bis(indole) $\mathbf{1 6 5}^{5}(16 \mathrm{mg}, 54 \%$ yield) as a yellow powder.

Pyrazinone 22b. A reaction tube charged with indolylpyrazine $\mathbf{7 3}^{12}(125 \mathrm{mg}$, $0.335 \mathrm{mmol})$, boronic ester $\mathbf{1 7 5}(90 \mathrm{mg}, \quad 0.168 \mathrm{mmol})$, and tetrakis(triphenylphosphine)palladium(0) ( $35 \mathrm{mg}, 0.030 \mathrm{mmol}$ ) was evacuated and purged with $\mathrm{N}_{2}$. Deoxygenated benzene ( 3.5 mL ), deoxygenated methanol ( $690 \mu \mathrm{~L}$ ), and deoxygenated 2 M aq. $\mathrm{Na}_{2} \mathrm{CO}_{3}(180 \mu \mathrm{~L})$ were then added. The reaction mixture was sparged with argon for 2 min . The tube was then sealed, heated to $50^{\circ} \mathrm{C}$ for 48 h , cooled to $23{ }^{\circ} \mathrm{C}$, and quenched by the addition of $\mathrm{Na}_{2} \mathrm{SO}_{4}(200 \mathrm{mg})$. The reaction mixture was filtered over a plug of $\mathrm{SiO}_{2}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ eluent), and the solvent was evaporated under
reduced pressure. The crude product was purified by flash chromatography (2:1 $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ :hexanes eluent) to afford bis(indole) $\mathbf{1 7 6}$ ( $62 \mathrm{mg}, 53 \%$ yield), which was used immediately in the subsequent reaction.

Bis(indole) $\mathbf{1 7 6}$ ( $30 \mathrm{mg}, 0.043 \mathrm{mmol}$ ) was dissolved in 1.0 M TBAF in THF ( 1 $\mathrm{mL}, 1 \mathrm{mmol}$ ) and heated to $65^{\circ} \mathrm{C}$ for 16 h . After cooling to $23^{\circ} \mathrm{C}$, the solvent was removed under reduced pressure, and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ was added. The organic layer was washed with $\mathrm{H}_{2} \mathrm{O}(2 \times 1 \mathrm{~mL})$ and brine $(1 \mathrm{~mL})$, concentrated to dryness, then purified by flash chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ eluent) to give bis- N -deprotected intermediate 177 (16 $\mathrm{mg}, 89 \%$ yield). A mixture of crude $177(1.5 \mathrm{mg}, 0.0034 \mathrm{mmol})$, LiI ( $100 \mathrm{mg}, 0.75$ mmol ), and collidine ( 1 mL ) was heated to $130^{\circ} \mathrm{C}$ for 4 days. After cooling to $23^{\circ} \mathrm{C}$, the reaction mixture was diluted with $\mathrm{EtOAc}(5 \mathrm{~mL})$, washed with $\mathrm{H}_{2} \mathrm{O}(3 \times 5 \mathrm{~mL})$ and brine $(2 \mathrm{~mL})$, then dried by passage over a plug of $\mathrm{SiO}_{2}(\mathrm{EtOAc}$ eluent $)$. The solvent was removed under reduced pressure to afford known pyrazone $\mathbf{2 2 b}^{9}$ ( $1.0 \mathrm{mg}, 69 \%$ yield).

## APPENDIX SIX

## A Strategy for the Preparation of Dragmacidin E

## A6.1 Background

## A6.1.1 Introduction

To date, dragmacidin $\mathrm{E}(\mathbf{6})$ is the only member of the dragmacidin family that has not been synthesized (Figure A6.1.1). In 2000, when the Stoltz laboratory began, we developed a strategy to prepare this complex alkaloid. This appendix section describes our novel approach to the total synthesis of dragmacidin E and highlights our preliminary results involving the synthesis of model systems. ${ }^{1}$

Figure A6.1.1

## A6.1.2 Retrosynthetic Analysis of Dragmacidin E

Our retrosynthetic strategy for the preparation of dragmacidin E (6) is shown below in Scheme A6.1.1. We envisioned that the guanidinium unit could be installed at a late-stage in the synthesis, and the pyrazinone moiety could be masked as a pyrazine. Thus, the natural product (6) was disconnected to bis(indole)pyrazine 178. The seven-
membered ring of dragmacidin $E$ could then be installed from cyanotriazine 180 via a hetero-aryl Diels-Alder/Retro Diels-Alder sequence with concomitant loss of $\mathrm{N}_{2}(\mathbf{1 8 0} \rightarrow$ $\mathbf{1 7 9} \rightarrow \mathbf{1 7 8}){ }^{2,3}$ Aromatic triazine $\mathbf{1 8 0}$ would be obtained from a non-aromatic triazinone (181), which in turn could be prepared via a cyclocondensation reaction of amidrazone 182 and ketoester 183. Although indole-ketoesters are well known in the literature, indole-amidrazones are not. Therefore, our initial goal was to develop a simple synthesis of indole-amidrazones and then utilize those amidrazones to access bis(indole)triazinones.

Scheme A6.1.1

## A6.2 Model Systems: The Facile Synthesis of Bis(indole)-1,2,4-Triazinones

The preparation of unsubstituted indole-amidrazones turned out to be relatively straightforward (Scheme A6.2.1). Beginning from commercially available indole (20), we were able to access cyanoindole 184 in three steps using a known protocol. ${ }^{4}$ Then, simply treating 184 with sodium hydrazide in refluxing THF afforded the desired amidrazone (185) in good yield. ${ }^{5}$

Scheme A6.2.1

In the cyclocondensation reaction, exposure of amidrazone $\mathbf{1 8 5}$ to ketoester $\mathbf{1 8 6}^{6}$ in the presence of $\mathrm{MgSO}_{4}$ in methanol, ${ }^{5}$ followed by reflux in DMF, afforded the desired p-triazinone product (187) in $68 \%$ yield (Scheme A6.2.2). m-Triazinone $\mathbf{1 8 8}$ was also formed, although in low yield. After separation by silica gel chromatography, the C-C connectivity of each of the triazinone products ( $\mathbf{1 8 7}$ and $\mathbf{1 8 8}$ ) was determined by single crystal X-ray diffraction studies. ${ }^{7 \mathrm{ab}}$

## Scheme A6.2.2

We also prepared the corresponding 1-methylated cyclization starting materials, methylamidrazone $\mathbf{1 8 9}$ and methylketoester $\mathbf{1 9 0}^{8}$ (Scheme A6.2.3). When these compounds were reacted under similar conditions to those described above, triazinone formation proceeded readily. However, the product distribution favored $m$ methyltriazinone 192 over p-methyltriazinone 191. This reversal in selectivity is presumably due to the electron donating effect of the $N$-Me group on the ketone functionality of $\mathbf{1 9 0}$, thereby altering its reactivity.

Scheme A6.2.3

Structural assignments for $N$-methyl derivatives 191 and 192 were made by correlating ${ }^{1} \mathrm{H}$ NMR and TLC data with data for the corresponding $N$-H compounds ( $\mathbf{1 8 7}$ and 188, respectively). In addition, methyltriazinone 191 was treated with allyl bromide under phase transfer conditions to afford allyl derivative 193 (Scheme A6.2.4). X-ray diffraction analysis of a single crystal revealed the C-C connectivity of allyl species $\mathbf{1 9 3}$ and confirmed that triazinone 191 was para-substituted. ${ }^{7 c}$

Scheme A6.2.4

While the cyclocondensation strategy described above was effective for the preparation of para-substituted bis(indole)triazinones 187 and 191, initial attempts to aromatize those compounds to their triazine counterparts (194 and 195) were met with limited success (Scheme A6.2.5). ${ }^{9}$ Although further work in this area has not been carried out, an alternative strategy to directly access bis(indole)triazines, rather than triazinones, would be attractive in order to access substrates suitable for the critical DielsAlder/Retro Diels-Alder sequence en route to dragmacidin E(6).

Scheme A6.2.5

## A6.3 An Alternative Strategy to Access Bis(indole)triazines

Based on our work related to the other dragmacidins (see Chapters 2 and 3), an alternative cross-coupling approach to access aromatic bis(indole)triazines (180) can also be envisioned (Scheme A6.3.1). In this scenario, 180 would be obtained by the sequential cross-coupling reactions of metalated indoles (171 and 172) and a dihalogenated triazine (196). Notably, it may be possible to utilize the same indole fragments ( $\mathbf{6 2}$ and 54b) that were employed in the total synthesis of dragmacidin D. The appropriate halogenated triazine (196) would likely be discovered after some experimentation; however, known dichloride $19 \mathbf{7}^{10}$ could serve as a starting point for
optimization. This promising cross-coupling strategy to access dragmacidin E (6) has not yet been explored.

Scheme A6.3.1

## A6.4 Conclusion

In summary, we have developed a facile method for the synthesis of bis(indole)triazinones involving a cyclocondensation reaction between amidrazone and ketoester functionalities. Although we have only prepared simple model systems thus far, more highly functionalized bis(indole)triazinones could potentially be used as intermediates en route to the total synthesis of dragmacidin E (6). Additionally, in future efforts, it may be possible to access substituted bis(indole)triazines via halogen-selective cross-coupling reactions.

## A6.5 Experimental Section

## A6.5.1 Materials and Methods

Unless stated otherwise, reactions were conducted in flame-dried glassware under an atmosphere of nitrogen using anhydrous solvents (either freshly distilled or passed through activated alumina columns). All commercially obtained reagents were used as received. Reaction temperatures were controlled using an IKAmag temperature modulator. Thin-layer chromatography (TLC) was conducted with E. Merck silica gel 60 F254 pre-coated plates ( 0.25 mm ) and visualized using a combination of UV, anisaldehyde, and potassium permanganate staining. ICN silica gel (particle size 0.0320.063 mm ) was used for flash column chromatography. ${ }^{1} \mathrm{H}$ NMR spectra were recorded on a Varian Mercury 300 (at 300 MHz ) or a Varian Inova 500 (at 500 MHz ) and are reported relative to $\mathrm{Me}_{4} \mathrm{Si}(\delta 0.0)$. Data for ${ }^{1} \mathrm{H}$ NMR spectra are reported as follows: chemical shift ( $\delta \mathrm{ppm}$ ), multiplicity, coupling constant $(\mathrm{Hz})$, and integration. ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Varian Mercury 300 (at 75 MHz ) or a Varian Inova 500 (at 125 MHz ) and are reported relative to $\mathrm{Me}_{4} \mathrm{Si}(\delta 0.0)$. Data for ${ }^{13} \mathrm{C}$ NMR spectra are reported in terms of chemical shift. IR spectra were recorded on a Perkin Elmer Paragon 1000 spectrometer and are reported in frequency of absorption $\left(\mathrm{cm}^{-1}\right)$. High resolution mass spectra were obtained from the California Institute of Technology Mass Spectral Facility. X-ray crystallographic structures were obtained by Mr. Larry M. Henling and Dr. Mike W. Day at the California Institute of Technology Beckman Institute X-Ray Crystallography Laboratory.

## A6.5.2 Preparative Procedures

Amidrazone 185. To a suspension of NaH ( $60 \%$ dispersion in mineral oil, 167 $\mathrm{mg}, 4.16 \mathrm{mmol})$ in $\mathrm{Et}_{2} \mathrm{O}(3.5 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$ was added anhydrous hydrazine $(131 \mu \mathrm{~L}, 4.15$ $\mathrm{mmol})$. After stirring for 1 h , a solution of cyanoindole $\mathbf{1 8 4}^{4}(200 \mathrm{mg}, 1.39 \mathrm{mmol})$ in THF ( 7 mL ) was added dropwise over 10 min . The reaction mixture was heated to $60{ }^{\circ} \mathrm{C}$ for 6 h , cooled to $23^{\circ} \mathrm{C}$, quenched by the addition of $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$, and extracted with EtOAc ( $3 \times 20 \mathrm{~mL}$ ). The combined organic extracts were washed with brine ( 15 mL ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure. The residue was triturated with $\mathrm{Et}_{2} \mathrm{O}(2 \mathrm{~mL})$ and dried under vacuum to afford amidrazone $185(213 \mathrm{mg}, 87 \%$ yield), which was used immediately in the subsequent reaction. ${ }^{1} \mathrm{H} \mathrm{NMR}$ ( 300 MHz , DMSO- $d_{6}$ ): $\delta 11.10(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 8.15(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.69(\mathrm{~s}, 1 \mathrm{H}), 7.33(\mathrm{~d}, J=8.1 \mathrm{~Hz}$, $1 \mathrm{H}), 7.10-7.03(\mathrm{~m}, 1 \mathrm{H}), 7.01-6.93(\mathrm{~m}, 1 \mathrm{H}), 5.48(\mathrm{br} \mathrm{s}, 2 \mathrm{H}), 4.83(\mathrm{br} \mathrm{s}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (75 MHz, DMSO- $d_{6}$ ): $\delta 145.3,136.3,124.8,123.6,122.2,121.2,119.0,111.3,111.1$.

Triazinones 187 and 188. To crude amidrazone 185 ( $100 \mathrm{mg}, 0.568 \mathrm{mmol}$ ) and $\mathrm{MgSO}_{4}(171 \mathrm{mg}, 1.42 \mathrm{mmol})$ in $\mathrm{MeOH}(2 \mathrm{~mL})$ at $23^{\circ} \mathrm{C}$ was added a solution of ester $\mathbf{1 8 6}^{6}(105 \mathrm{mg}, 0.516 \mathrm{mmol})$ in $\mathrm{MeOH}(5 \mathrm{~mL})$. The reaction mixture was heated to $40{ }^{\circ} \mathrm{C}$ for 24 h , then cooled to $23^{\circ} \mathrm{C}$. After removal of solvent under vacuum, DMF ( 5 mL ) was added. The resulting suspension was refluxed for 24 h , then cooled to $23{ }^{\circ} \mathrm{C}$. The solvent was removed under vacuum, and the crude product was purified by flash column chromatography ( $1: 1$ hexanes:EtOAc eluent) to afford $p$-triazinone 187 ( $115 \mathrm{mg}, 68 \%$ yield) and $m$-triazinone 188 ( $30 \mathrm{mg}, 18 \%$ yield) as yellow solids. For 187, suitable crystals for X-ray diffraction were grown by the slow diffusion of hexanes into a saturated solution of $\mathbf{1 8 7}$ in 1:1 DMF:MeOH. For 188, single crystals suitable for X-ray diffraction were obtained by the slow diffusion of hexanes into a saturated solution of 188 in MeOH. p-Triazinone 187: $\mathrm{R}_{f} 0.28$ (4:1 EtOAc:hexanes); mp $>250{ }^{\circ} \mathrm{C}$ dec; ${ }^{1} \mathrm{H}$ NMR (500 MHz, DMSO- $d_{6}$ ): $\delta 13.66$ (br s, 1H), 12.03 (s, 1H), 11.67 (s, 1H), 8.83 (s, $1 \mathrm{H}), 8.52(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 8.50-8.45(\mathrm{~m}, 1 \mathrm{H}), 8.44(\mathrm{~d}, J=2.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.55-7.51$ (comp. m, 2H), 7.28-7.17 (comp. m, 4H); ${ }^{13} \mathrm{C}$ NMR ( 125 MHz , DMSO- $d_{6}, 16 / 19 \mathrm{C}$ ): $\delta$ 136.7, 136.3, 131.6, 129.0, 125.3, 125.2, 122.7, 122.3, 122.1, 121.9, 121.1, 120.5, 112.2, 112.0, 108.1, 106.2. CCDC deposition number 259291; IR (film) 3350, 1520, 1421,
$1187 \mathrm{~cm}^{-1}$; HRMS-FAB $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{19} \mathrm{H}_{14} \mathrm{~N}_{5} \mathrm{O}, 328.1198$; found, 328.1185. $m$-Triazinone 188: $\mathrm{R}_{f} 0.61$ (4:1 EtOAc:hexanes); $\mathrm{mp}>250{ }^{\circ} \mathrm{C}$ dec; ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , DMSO- $d_{6}$ ): $\delta 13.12(\mathrm{~s}, 1 \mathrm{H}), 12.13(\mathrm{~s}, 1 \mathrm{H}), 11.54(\mathrm{~s}, 1 \mathrm{H}), 9.12(\mathrm{~d}, J=2.9 \mathrm{~Hz}, 1 \mathrm{H}), 8.77$ $(\mathrm{d}, J=7.3 \mathrm{~Hz}, 1 \mathrm{H}), 8.26(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 8.14(\mathrm{~d}, J=2.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.60-7.47(\mathrm{comp}$. $\mathrm{m}, 2 \mathrm{H}$ ), 7.39-7.26 (comp. m, 2H), 7.25-7.12 (comp. m, 2H). CCDC deposition number 161494.

Methylamidrazone 189. Methylamidrazone 189 was prepared in a manner analogous to the preparation of $\mathbf{1 8 5}$. To a suspension of $\mathrm{NaH}(60 \%$ dispersion in mineral oil, $779 \mathrm{mg}, 19.48 \mathrm{mmol})$ in $\mathrm{Et}_{2} \mathrm{O}(16.2 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was added anhydrous hydrazine (611 $\mu \mathrm{L}, 19.48 \mathrm{mmol})$. After stirring for 1 h , a solution of $N$-methyl-3-cyanoindole ${ }^{11}$ (198, $910 \mathrm{mg}, 6.49 \mathrm{mmol})$ in THF ( 32.5 mL ) was added dropwise over 10 min . The reaction mixture was heated to $60^{\circ} \mathrm{C}$ for 6 h , cooled to $23^{\circ} \mathrm{C}$, quenched by the addition of $\mathrm{H}_{2} \mathrm{O}$ $(17 \mathrm{~mL})$, and extracted with EtOAc ( $4 \times 25 \mathrm{~mL}$ ). The combined organic extracts were washed with brine ( $2 \times 25 \mathrm{~mL}$ ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure to afford crude amidrazone 189 ( $880 \mathrm{mg}, 79 \%$ yield), which was used immediately in the subsequent reaction without further purification. ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , DMSO- $\left.d_{6}\right): \delta 8.16(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.65(\mathrm{~s}, 1 \mathrm{H}), 7.39(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.18-7.11$ $(\mathrm{m}, 1 \mathrm{H}), 7.07-6.99(\mathrm{~m}, 1 \mathrm{H}), 5.43(\mathrm{br} \mathrm{s}, 2 \mathrm{H}), 4.81(\mathrm{br} \mathrm{s}, 2 \mathrm{H}), 3.76(\mathrm{~s}, 3 \mathrm{H})$.

Bis(methyl)triazinones 191 and 192. To crude amidrazone $189(65 \mathrm{mg}, 0.378$ $\mathrm{mmol})$ and $\mathrm{MgSO}_{4}(159 \mathrm{mg}, 1.32 \mathrm{mmol})$ in $\mathrm{MeOH}(2 \mathrm{~mL})$ at $23^{\circ} \mathrm{C}$ was added a solution of ester $\mathbf{1 9 0}^{8}$ ( $75 \mathrm{mg}, 0.343 \mathrm{mmol}$ ) in $\mathrm{MeOH}(3.4 \mathrm{~mL})$. The reaction mixture was stirred at $23^{\circ} \mathrm{C}$ for 24 h . After removal of solvent under vacuum, DMF ( 5 mL ) was added. The resulting suspension was refluxed for 24 h , then cooled to $23{ }^{\circ} \mathrm{C}$. The solvent was removed under vacuum, and the crude product was purified by flash chromatography (1:1 hexanes:EtOAc eluent) to afford p-bis(methyl)triazinone $191(20 \mathrm{mg}, 16 \%$ yield) as a yellow solid and impure $m$-bis(methyl)triazinone 192. The crude $m$-triazinone was repurified by flash chromatography (1:1 hexanes:EtOAc eluent) to afford pure 192 (86 $\mathrm{mg}, 71 \%$ yield) as a yellow solid. p-Bis(methyl)triazinone 191: $\mathrm{R}_{f} 0.10$ (1:1 hexanes:EtOAc); mp $>250{ }^{\circ} \mathrm{C} \mathrm{dec} ;{ }^{1} \mathrm{H}$ NMR ( 500 MHz, DMSO- $d_{6}$ ): $\delta 13.60(\mathrm{br} \mathrm{s}, 1 \mathrm{H})$, $8.79(\mathrm{~s}, 1 \mathrm{H}), 8.57-8.49$ (comp. m, 2H), $8.34(\mathrm{~s}, 1 \mathrm{H}), 7.60-7.52$ (comp. m, 2H), 7.33-7.20 (comp. m, 4H), $3.91(\mathrm{~s}, 3 \mathrm{H}), 3.90(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 75 MHz , DMSO- $d_{6}, 19 / 21 \mathrm{C}$ ): $\delta$ $153.9,137.2,136.8,135.1,132.5,125.9,125.7,122.6,122.4,122.2,122.1,121.1,120.6$, $110.5,110.1,107.6,106.3,33.3,32.9$; IR (film) $3600,1567,1539,1370 \mathrm{~cm}^{-1}$; HRMSFAB $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{21} \mathrm{H}_{18} \mathrm{~N}_{5} \mathrm{O}, 356.1511$; found, 356.1520. mBis(methyl)triazinone 192: $\mathrm{R}_{f} 0.43$ (1:1 hexanes:EtOAc); mp $>250{ }^{\circ} \mathrm{C}$ dec; ${ }^{1} \mathrm{H}$ NMR (300

MHz, DMSO- $d_{6}$ ): $\delta 13.15(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 9.14(\mathrm{~s}, 1 \mathrm{H}), 8.83(\mathrm{~d}, J=7.3 \mathrm{~Hz}, 1 \mathrm{H}), 8.28(\mathrm{~d}, J=$ $7.8 \mathrm{~Hz}, 1 \mathrm{H}), 8.14(\mathrm{~s}, 1 \mathrm{H}), 7.62(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.54(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.47-7.32$ (comp. m, 2H), 7.31-7.16 (comp. m, 2H), 3.96 (comp. m, 6H); ${ }^{13} \mathrm{C}$ NMR ( 75 MHz , DMSO- $\left.d_{6}, 20 / 21 \mathrm{C}\right): ~ \delta 157.7,153.2,148.0,140.0,137.6,137.2,131.4,126.3,124.9$, 123.2, 122.4, 122.1, 121.6, 120.3, 111.2, 110.7, 110.3, 109.2, 33.3, 32.9; IR (film) 3600, 1646, 1465, $1373 \mathrm{~cm}^{-1}$; HRMS-FAB $(m / z):[\mathrm{M}+\mathrm{H}]^{+}$calc'd for $\mathrm{C}_{21} \mathrm{H}_{18} \mathrm{~N}_{5} \mathrm{O}, 356.1511$; found, 356.1521 .

Allyl triazinone 193. To p-triazinone $191(25 \mathrm{mg}, 0.070 \mathrm{mmol})$ in THF at $23^{\circ} \mathrm{C}$, was added allyl bromide ( $6.7 \mu \mathrm{~L}, 0.078 \mathrm{mmol}), \mathrm{H}_{2} \mathrm{O}(150 \mu \mathrm{~L})$, powdered $\mathrm{KOH}(20 \mathrm{mg}$, $0.35 \mathrm{mmol})$, and tetrabutylammonium bromide $(0.2 \mathrm{mg}, 0.0007 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}(10 \mu \mathrm{~L})$. The resulting solution was stirred for 24 h , diluted with $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$, and extracted with EtOAc (3 x 15 mL ). The combined organic layers were washed with brine ( 10 mL ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure to afford allyl triazinone 193 ( $17 \mathrm{mg}, 61 \%$ yield). Single crystals suitable for X-ray diffraction were obtained by the slow diffusion of hexanes into a saturated solution of $\mathbf{1 9 3}$ in acetone. ${ }^{1} \mathrm{H}$ NMR (300 MHz, DMSO- $d_{6}$ ): $\delta 8.85(\mathrm{~s}, 1 \mathrm{H}), 8.42(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 8.14(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 8.02$ $(\mathrm{s}, 1 \mathrm{H}), 7.62-7.51$ (comp. m, 2H), 7.37-7.18 (comp. m, 4H), 6.30-6.15 (m, 1H), 5.40-5.28 (comp. m, 2H), $5.07(\mathrm{~d}, J=5.1 \mathrm{~Hz}, 2 \mathrm{H}), 3.92(\mathrm{~s}, 3 \mathrm{H}), 3.91(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 125 MHz , DMSO- $d_{6}$ ): $\delta 160.3,154.4,145.6,136.9,136.6,136.0,133.3,133.2,126.4,125.8,122.6$,

## Special Refinement Details

Refinement of $\mathrm{F}^{2}$ against ALL reflections. The weighted R -factor ( $w \mathrm{R}$ ) and goodness of fit (S) are based on $\mathrm{F}^{2}$, conventional R -factors ( R ) are based on F , with F set to zero for negative $\mathrm{F}^{2}$. The threshold expression of $\mathrm{F}^{2}>2 \sigma\left(\mathrm{~F}^{2}\right)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on $\mathrm{F}^{2}$ are statistically about twice as large as those based on F , and R-factors based on ALL data will be even larger.

All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Atomic coordinates ( $\mathbf{x} 10^{4}$ ) and equivalent isotropic displacement parameters $\left(\AA^{2} \mathbf{x}\right.$ $10^{3}$ ) for 187 (CCDC 259291). $\mathrm{U}(\mathrm{eq})$ is defined as the trace of the orthogonalized $\mathrm{U}^{\mathrm{ij}}$ tensor.

| Largest diff. peak and hole | $0.205 \mathrm{and}-0.214 \mathrm{e} . \AA^{-3}$ |

## Special Refinement Details

Refinement of $\mathrm{F}^{2}$ against ALL reflections. The weighted R-factor ( $w \mathrm{R}$ ) and goodness of fit (S) are based on $F^{2}$, conventional $R$-factors ( R ) are based on $F$, with $F$ set to zero for negative $\mathrm{F}^{2}$. The threshold expression of $\mathrm{F}^{2}>2 \sigma\left(\mathrm{~F}^{2}\right)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on $\mathrm{F}^{2}$ are statistically about twice as large as those based on F , and R-factors based on ALL data will be even larger.

All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Atomic coordinates ( $\mathbf{x} 10^{4}$ ) and equivalent isotropic displacement parameters ( $\AA^{2} \mathbf{x}$ $10^{3}$ ) for 193 (CCDC 259195). $\mathrm{U}(\mathrm{eq})$ is defined as the trace of the orthogonalized $\mathrm{U}^{\mathrm{ij}}$ tensor.

## APPENDIX SEVEN

## Notebook Cross-Reference

The following notebook cross-reference has been included to facilitate access to the original spectroscopic data obtained for the compounds presented in this thesis. For each compound, both hardcopy and electronic characterization folders have been created that contain copies of the original ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, and IR spectra. All notebooks and spectral data are stored in the Stoltz archives.

## INDEX

Alkaloid ..... $1,2,13,17,36,310,311,313,321$
Alzheimer's disease ..... 5
Amidrazone ..... 322, 323, 324, 327
Amino Acid ..... 7
Aminoimidazole ..... $6,9,11,20,29,30,31$,
$32,34,74,132,140$
Antifungal ..... 3
Anti-inflammatory ..... 7
Antipode ..... 145, 159
Antiviral ..... 3, 7, 131
Arginine ..... 5, 6
Arndt-Eistert ..... 29, 31
Aromatic ..... $9,20,24,27,322,326,365$
Asymmetric hydrogenation ..... 35, 76
Bartoli indole synthesis ..... 27, 72
Bicycle ..... $131,132,133,137,138,139$,$142,148,151,152,153,155$
Biosynthesis ..... $.7,8,17$
Biosynthetic ..... $8,19,145$
Bis(indole) $1,2,3,6,10,12,18,20,21,23$,$24,28,34,36,131,310,311,312$$314,315,321,322,323,326,327$Boronic acid$12,27,132,311,312$
Boronic ester$24,28,132,139,156,314$
Bromination ..... 27, 139, 156
Bromoindole ..... $23,26,27,71,132,312,314$
Brown's Rh Catalyst ..... 154
Cancer ..... 1, 6
Conformation ..... 149, 150, 151, 221, 222
Cross-coupling $12,20,23,24,69,70,132,156,159$,
$214,215,311,312,313,315,326,327$
Cyclization $.9,18,132,133,136,137,138,148$,$149,151,152,153,159,213,324$
Cyclocondensation ..... $11,20,21,22,23,69$,
320, 322, 323, 326, 327
Cytotoxicity ..... 3, 5, 6
Decomposition ..... $5,31,34,138$
Diels-Alder reaction ..... 322, 326
Diazo ..... 26, 29
Dihydrohamacanthin. ..... $16,310,313,314,315$
Dragmacidin ..... $1,2,8,13$
Dragmacidin A ..... $.2,8,13$
Dragmacidin B 2, 8, 13, and Appendix 5
Dragmacidin C 2, 8, 13, and Appendix 5
Dragmacidin D $2,3,5,6,7,8,10,11,12,131,131,132$,139, 140, 141, 145, 147, 311, and Chapter 2
Dragmacidin E $2,3,6,8,9,10,13,19$,
145, 147, and Appendix 6
Dragmacidin F $2,3,6,7,8,9,13,19$, and Chapter 3
Enantiodivergent ..... 147, 159, 220
Favorskii rearrangment ..... 142
Friedel-Crafts ..... 9
Fluorescence ..... 34
Guanidine ..... $11,29,30,321$
Halogen $17,24,26,27,36,131,132,133,139,156$,
$159,310,311,312,313,314,315,326,327$
Hamacanthin ..... $.2,16$
Heck reaction ..... $132,133,136,137,138,213,216,217$
Heterocycle ..... 132, 143
HIV ..... 7
HSV ..... 7
Huntington's disease ..... 5
Isomerization $135,149,150,151,154,155,159,215,221$
Kinase. ..... 1,4
Leimgruber-Batcho indole synthesis ..... $11,18,71,72$

Tryptamine ..... 8
Tryptophan ..... 8, 9
Weinreb amide ..... 136
Wittig olefination ..... 133
X-ray ..... 323, 325

## ABOUT THE AUTHOR

Neil K. Garg was born on December 18, 1978, in White Plains, NY. His immediate family consists of an older brother, Bobby, and two loving parents, Desh and Neena. Neil's childhood years were spent living in Fishkill, NY, a suburb 90 miles north of New York City. He attended John Jay Senior High School and pursued several extracurricular activities including tennis, soccer, and playing the trombone in a jazz band.

After graduating from high school in 1996, Neil began undergraduate studies at New York University. His early years at NYU were spent learning about a broad range of topics including psychology, writing, chemistry, biology, capitalism, and African culture. The sciences were undoubtedly his forte, and he began working in a chemistry research laboratory with Professor Marc Walters during his sophomore year. Neil also grew fond of teaching chemistry and continued both research and teaching until he graduated with a B.S. in chemistry in 2000. During his college years, Neil spent several months living in Strasbourg, France, and conducted research with Professor Mir Wais Hosseini at Université Louis Pasteur. While in France, Neil enjoyed exploring the French countryside on bike and hiking in the Vosges Mountains.

In 2000, Neil moved to Pasadena, CA, to pursue doctoral studies with Professor Brian M. Stoltz at the California Institute of Technology. In 2005, he earned his Ph.D. in chemistry for investigations involving the total synthesis of the dragmacidin alkaloids. Neil will marry his fiancée, Lindsey Bogard, in April 2005, and then begin postdoctoral studies under the direction of Professor Larry E. Overman at UC Irvine soon afterwards.

[^0]:    ${ }^{\dagger}$ This work was performed in collaboration with Dr. Richmond Sarpong, a postdoctoral scholar in the Stoltz group.

[^1]:    ${ }^{\dagger}$ This work was performed in collaboration with Daniel D. Caspi, a graduate student in the Stoltz group.
