Acknowledgments

I thank Jeroen Tromp for his supervision, collaboration, and scientific inspiration over the past five years. His expertise, ambition, and optimism provided a steady platform for undertaking the work in this thesis. Our scientific endeavors were exciting because they were uncertain. They followed a steady progression from theoretical foundations, to extensive modeling, to real applications. As a scientist, mentor, and teacher, Jeroen set a standard of excellence.

I thank my closest colleague and good friend, Qinya Liu. Qinya provided critical technical and scientific support in my initial years at Caltech. Her PhD research (e.g., *Liu and Tromp*, 2006), along with previous work by Dimitri Komatitsch (*Komatitsch et al.*, 2004), was vital for our tomographic inversion in southern California. I have learned a lot from Qinya over the years, and I hope I am beginning to return the favor.

I have appreciated interactions with past and present members of our research group. In particular, collaborations with Alessia Maggi and Min Chen have strengthened my thesis. I also thank Viola Carter and Donna Mireles, honorary group members, for handling many logistics over the past five years, and for providing a fun atmosphere in the Seismo Lab. I am grateful to John Woodhouse for supervising my Master's thesis at Oxford, and I benefitted from collaborations with John, Daniel Peter, and Lapo Boschi.

I benefited greatly from academic endeavors at Caltech that are not within this thesis. I thank Mark Simons and Pablo Musé for collaborating on a project involving the estimation of GPS velocity fields using spherical wavelets (*Tape et al.*, 2009). Mike Gurnis, Hiroo Kanamori, and Mark Simons have enthusiastically supported my pursuit of subduction zone parameters. In this endeavor, I hope to better understand what controls the maximum-moment earthquake and the dip of slabs in subduction zones (*Ruff and Kanamori*, 1980; *Jarrard*, 1986). I look forward to continuing both of these collaborations in the future.

I am grateful to the scientists at Caltech who helped turn me into a geophysicist: Jean-Philippe Avouac, Rob Clayton, Mike Gurnis, Egill Hauksson, Don Helmberger, Hiroo Kanamori, Nadia Lapusta, Tapio Schneider, Mark Simons, and Joann Stock. I have learned much from them through classes, seminars, and personal interactions. Two classes by Hiroo Kanamori set a standard of teaching excellence I will aim to emulate.

I am also grateful for scientists who visited Caltech, in particular, Albert Tarantola and Malcolm Sambridge. Tarantola changed the way I view geophysics, science, and life around me. His scientific approach is idealistic, ambitious, and feasible. Sambridge provided key insights for our tomographic problem, and these are incorporated in Chapter 4. His class on inverse methods, his contributions in group meeting, and his outstanding performance on the soccer field made his visit memorable in many ways.

Two components were essential for conducting our tomographic study of southern California: data and computers. Without the data, there is no inverse problem. I thank the Southern California Data Center (Egill Hauksson, Ellen Yu), the Northern California Data Center (Doug Neuhauser), the IRIS data center (Tim Ahern), and the University of Nevada Reno (Glenn Biasi) for providing seismograms used in our study. Without the computing power, our technique is not feasible. I thank Jeroen Tromp and Mike Gurnis for having the vision of computational infrastructure within the Division of Geological and Planetary Sciences. I used 0.8 million CPU-hours in the tomographic inversion, and I recognize the luxury of having access to such a computational facility. I thank Naveed Near-Ansari and John Lilley for keeping the cluster up and running, and for hundreds of replies to my emails. I thank the code management facility of the Computational Infrastructure for Geodynamics (CIG), in particular Wei Mi, Sue Kientz, and Leif Strand. I also thank the phenomenal IT support in the GPS Division at Caltech: Mike Black, Scott Dungan, and Ken Ou.

Regarding southern California earthquakes and structure, I received scientific feedback or unpublished data from the following people: Jeanne Hardebeck, Guoqing Lin, Egill Hauksson, Don Helmberger, Ying Tan, Shengji Wei, Rob Clayton, Hiroo Kanamori, Tom Brocher, Christiane Stidham, John Shaw, Andreas Plesch, Ying Tan, Jeff McGuire, Gary Fuis, Janice Murphy, Nik Christensen, and Paul Friberg. I benefitted from discussions of geology or geodynamics with Mark Legg, Jason Saleeby, Steve Kidder, Alan Chapman, Elisabeth Nadin, Mihai Ducea, Peter Luffi, Laetitia Le Pourhiet, and Leon Silver. Regarding structure and simulations in the Bay Area region, I benefitted from discussions with Artie

Rodgers and Brad Aagaard.

I participated in several field trips that left me with indelible memories and helped shape my geological background. I joined Joe Kirshvink on five outstanding Bob-Sharp-style Ge136 field trips in the southwestern United States. Jean-Philippe Avouac led a phenomenal active tectonics trip to Tian Shan in far western China. Jason Saleeby and Paul Asimow led a memorable trip to Hawaii, where we even observed graded sedimentary bedding in the form of peridotite xenoliths within a relict lava river channel. And Joann Stock supported an epic (at least in the life of a graduate student) geophysics research cruise from Antarctica to New Zealand.

I thank my thesis committee: Rob Clayton, Mark Simons, Don Helmberger, Egill Hauksson, and Jeroen Tromp.

I am grateful to all of my Caltech acquaintances, officemates, and friends, especially Willy Amidon (Susan Parsons) and Yoshi Kaneko (Misaki Miyazawa). My positive experience at Caltech is partly attributable to Yoshi.

I thank my family: my brother Ken, my mom Jeanne, and my dad Walt.

And I thank my incredible, wonderful wife, Elisabeth Nadin.
