

Acknowledgments

Science is not done solely by individuals. We could not accomplish what we do without our mentors and colleagues. At this point in my life I would like to take the time to acknowledge those who have provided me with help along the way, and the people who have shaped the person I am today.

First I would like to thank my advisor Professor William L. Johnson. He has opened a new door for me to view the world through. His discussions have been enlightening and inspirational for me. His enthusiasm for science has always invigorated me with a desire to investigate new and interesting topics. He has guided me throughout my time here at Caltech, and I feel that my success is directly linked to his guidance. I simply hope that as I grow in years I will retain that which he has shown me.

I have had many heated arguments with Dr. Marios Demetriou, but through it all he actually managed to teach me a few things, and I hope that I did the same for him. He introduced me to the project that led to my current thesis. I am grateful that he has been my constant coworker throughout this project. We have accomplished more than I would have thought possible when I first arrived at Caltech. I consider him a friend and I appreciate what he has done for me.

Professor Guruswami Ravichandran allowed me to use the facilities in his lab. I am truly grateful for his generosity. I also am thankful for the discussions I had with him regarding fracture associated with these experiments. I am also thankful for the help of Dr. Min Tao, a previous graduate student of Professor Ravichandran. She taught me to use the equipment in Professor Ravichandran's lab, and she was my coworker on the initial parts of this project.

I came to graduate school because of Professor Kenneth Liechti. He guided my initial attempts at dealing with science. He provided me with support and guidance. Looking back it almost seems like I was a child first learning to walk. I appreciate him giving me the freedom to explore an interesting topic, and to grow by teaching myself instead of telling me what to do at every juncture. It was with him that I first realized how interested I was in Science itself.

There are many people in my group that I would like to thank for discussions and advice over the years. Professor Jan Schroers was involved in the first project that I worked on at Caltech, and he taught me how to make the platinum alloy he developed. I would like to thank Chris Veazey for making me feel welcome when I first came to this group, and for his help in teaching me about metallic glasses. Professor Dale Conner has also provided many insights and ideas to me, and for this I am grateful. I would also like to thank Mary Laura Lind for the use of the Ultrasonic setup that she constructed, and for teaching me how to use it. For those in my group that I have not mentioned directly, thank you for your companionship and help over these last number of years.

I want to express my gratitude to my entire thesis committee: Professor William L Johnson, Professor Guruswami Ravichandran, Professor Kaushik Bhattacharya, Professor William Goddard, and Professor Brent Fultz. I appreciate them taking the time to review this thesis. I am also grateful for their valuable suggestions and criticisms.

I have missed my family, but I cherish the support and love that they have shown me while I have been here. When I needed them, they were there for me. I will never forget where I am from, and I will always love them.

Lastly, I would like to thank my wife Gitrada. I never thought I would meet someone like her, especially at Caltech. She has supported me when I have needed that helping hand, and I have tried to do the same for her. Graduation is a stressful time for everyone that goes through it, but I know that we will get through it together. I will cherish you always.

This work was supported in part by the MRSEC Program of the National Science Foundation under award No. DMR0520565.
