## Syntheses.

Adamantane-1-carboxylic acid [4-(5-dimethylamino-naphthalene-1-sulfonylamino)-
butyl]-amide (1): (D-4-Ad) 0.100 g ( 0.312 mmole ) 3, 74.5 mg ( 0.37 mmole ) 1adamantyl carbonyl chloride, and 0.11 mL ( 0.62 mmole ) $\mathrm{N}, \mathrm{N}$-diisopropylethylamine were dissolved in 5 mL dry DMF under Ar and stirred overnight at ambient temperature. The reaction mixture was diluted with $25 \mathrm{~mL} \mathrm{CH}_{2} \mathrm{Cl}_{2}$, washed twice with water, and the organic phase concentrated under reduced pressure. The crude product was purified via flash chromatography using $9: 1 \mathrm{MeOH}: \mathrm{CH}_{2} \mathrm{Cl}_{2}$ as eluent to give the product as a pale yellow-green solid. P450cam:D-8-Ad Crystallization and Data Collection. The C334A P450cam:D-8-Ad complex was formed at a molar ratio of $1: 1(400 \mu \mathrm{M})$ at room temperature and crystallized by hanging drop vapor diffusion at $4^{\circ} \mathrm{C}$. Crystals were obtained under 0.1 M citrate ( pH 5.5 ), $200 \mathrm{mM} \mathrm{KCl}, 13 \%$ (wt/vol) polyethylene glycol (PEG; molecular weight $=8,000$ ). For diffraction experiments, crystals were soaked in a solution containing 0.75 M citrate ( pH 5.5 ), $150 \mathrm{mM} \mathrm{KCl}, 10 \%$ (wt/vol) PEG 8000, and 25\% (wt/vol) PEG 400 for 1 minute and flash frozen in liquid nitrogen. Data were collected on an Raxis IV detector equipped with Osmic confocal mirrors and Xstream cryo-device (100K) using $\mathrm{CuK}_{\alpha}$ radiation $(\lambda=1.5418 \AA$ ) from a Ru200 X-ray generator operated at $50 \mathrm{kV}, 100$ mA . Data were processed using DENZO and SCALEPACK. ${ }^{4}$ The space group was $\mathrm{P} 2_{1} 2_{1} 2_{1}$ with cell dimensions: $\mathrm{a}=64.95, \mathrm{~b}=75.31, \mathrm{c}=93.17 \AA^{3}$ (Matthews coefficient $\left(\mathrm{V}_{\mathrm{M}}\right)=2.50$; solvent content $\left.=49.9 \%\right)$.

Structure Determination. The structure was solved by molecular replacement using the program AMoRE ${ }^{5}$ with camphor-bound P 450 cam ( PDB code 2 cpp ) as the initial model. After initial rigid body refinement in CNS, ${ }^{6}$ further refinement was carried out by iterative cycles of simulated annealing and B factor refinement using CNS and manual fitting using XFIT. 7 The heme and D-8-Ad were located in $\left|F_{o}\right|-\left|F_{c}\right|$ electron density omit maps and further refined by simulated annealing and manual fitting. The difference
electron density map $\left(\left|\mathrm{F}_{\text {obs }}\right|-\left|\mathrm{F}_{\text {calc }}\right|\right)$ of the D-8-Ad is well defined and continuous, and the average B-factor for D-8-Ad is moderately low ( $38 \AA^{2}$ ) confirming the high occupancy of the ligand. The final model, which includes residues $(11-414)$ of P450cam, D-8-Ad, heme, and 301 waters, gave $\mathrm{R}_{\text {factor }} / \mathrm{R}_{\text {free }}$ values of 20.2 and 24.7.
