Chapter 4

The Puromycin Route to Assess Stereo- and Regiochemical Constraints on Peptide Bond Formation in Eukaryotic Ribosomes

4.1 Introduction

The protein synthesis machinery can be used to incorporate unnatural amino acids into peptides (1, 2, 3) proteins (4, 5), and molecular libraries (6, 7) (see references (8, 9, 10, 11, 12) for reviews). These studies indicate that the ribosome displays a broad ability to utilize residues beyond the 20 naturally occurring amino acids. Chemically misacylated-tRNA fragments and tRNAs have provided one route to probe the stereo- and regiospecificity of isolated ribosomes (13, 14, 15, 16) and intact translation systems (10, 17). This approach has expanded our understanding of the range of residues incorporated by the ribosome (18, 19, 20, 21). However, entry of both β-
and D-amino acids has proved challenging (2, 4, 13, 14, 15, 16). Analysis of these residues would deepen our understanding of the stereo- and regiochemical constraints of ribosome-mediated peptide bond formation. Here, we have used a series of synthetic puromycin analogs to measure the activity of both β- and D-amino acids in an intact eukaryotic translation system. Puromycin is a small-molecule mimic of aminoacyl-tRNA (aa-tRNA), and acts as a universal translation inhibitor by entering the ribosomal A site and participating in peptide bond formation with the nascent peptidyl chain (22). Puromycin and puromycin analogs have been very useful in exploring the activity of nucleophiles (-OH versus -NH₂ versus -SH) in peptide bond formation and the structural requirements for inhibition of translation (23, 24, 25, 26). Unlike aa-tRNA, puromycin is able to enter the ribosome independently, does not induce EF-Tu-GTPase activity (27), and does not require soluble translation factors for function (28). Puromycin and related compounds therefore provide a direct means to address ribosome-mediated peptide bond formation in the context of a fully competent translation extract.

### 4.2 Results and Discussion

We synthesized a series of puromycin derivatives (Figure 4.1) that differ in the 1) amino acid moiety, 2) amino acid stereochemistry, and 3) number of carbon units in the amino acid backbone. We then measured the activity of each compound (Figure 4.2 and Table 4.1) in a high dynamic-range IC₅₀ potency assay using the rabbit reticulocyte protein synthesis system (Figure 4.2A) (28). The naturally occurring compound, L-puromycin (1a), inhibits globin mRNA translation with an IC₅₀ of 1.8 μM (Figure 4.2B). Surprisingly, D-puromycin (1b) also inhibited translation giving an IC₅₀ of 280 μM (Figure 4.2B), a difference of 150-fold (Table 4.1). We reasoned that stereoselectivity should be a function of the sidechain size and geometry. To test this, we constructed compounds where the puromycin sidechain was altered to bear either

Table 4.1: IC$_{50}$ values for puromycin analogs.

a bulky (L- or D-4-methyl-phenylalanine; 2a and 2b) or a small substituent (L- or D-alanine; 3a and 3b). Compound 2a inhibits translation better than puromycin itself (IC$_{50}$ = 1.0 $\mu$M; Table 4.1) and is the most potent compound we constructed. The D-amino acid variant (2b) shows much lower activity (IC$_{50}$ = 2400 $\mu$M), is $\sim$9-fold lower than D-puromycin (1b), and is 2400-fold less potent than the L-isomer. The alanine analogs (R = CH$_3$) show only 3-fold selectivity for the L- versus D-isomers (3a versus 3b; Table 4.1).

These observations argue that ribosomal stereoselectivity falls over a broad range and is primarily dictated by the size and geometry of the pendant sidechain. Within the L-amino acid series (1a, 2a, and 3a), marked variation is also seen based solely on sidechain identity. Larger, hydrophobic sidechains provide improved function, consistent with previous observations (14, 25). In the D-amino acid series, the 4-$O$-methyltyrosine derivative (1b) functions the best overall, and has $\sim$3-fold better activity than the natural L-alanine variant (3a).

We next examined puromycin derivatives bearing $\beta$-amino acids. $\beta$-amino acids have been previously incorporated at low levels using nonsense suppression techniques (2, 4). In our experiments, both L-$\beta$-(4-Me)-Phe-PANS (2c) and L-$\beta$-Ala-PANS (3c)
were able to fully inhibit translation (IC$_{50}$ = 600 and 1700 µM, respectively; Table 4.1).

Finally, we wished to confirm that our puromycin analogs participated in peptide bond formation within the ribosome. Incorporation of puromycin blocks the C-terminus, rendering the protein carboxypeptidase resistant (22). Previous work in our laboratory demonstrated that covalent puromycin incorporation is most efficient near the IC$_{50}$ value (28). Consistent with this observation, protein synthesis performed in the presence of our puromycin derivatives near the IC$_{50}$ resulted in a 12- to 16-fold increase in carboxypeptidase Y (CPY)-resistant protein compared with the no drug control (Figures 4.3A,B). All derivatives also produce truncated protein fragments, consistent with entry and attachment both internally and at the end of the template (Figure 4.4) (28).

The structural basis for stereoselectivity in rabbit ribosomes cannot be addressed presently, as there are no high-resolution structures available. However, modeling D-puromycin (1b) into the active site of the *Haloarcula marismortui* 50S subunit (29) is consistent with the idea that steric effects play a role in chiral discrimination. In the atomic resolution structure, U2620 (U2585 *E. coli*) is the closest nucleotide to the D-sidechain (Figure 4.5). Also, while many of the ribosome active site nucleotides are highly conserved, the fact that critical residues can be mutated (30), implies that construction of ribosomes with altered stereo- and regiospecificity may be possible.

### 4.3 Conclusions

Our data lead us to conclude that L-, D-, and β-amino acids can participate in ribosome-mediated peptide bond formation when constructed as analogs of puromycin. This route allows us to rank both natural and unnatural residues as substrates in a physiologically complete protein-synthesizing system. Analysis using intact systems is important as reconstituted or purified systems that are incapable of synthe-
Figure 4.3: Carboxypeptidase Y (CPY) analysis of protein-puromycin products. TCA precipitation of $[^{35}S]$Met-protein (Ras) from translation reactions after CPY treatment containing (A) Ras only, L-puromycin (1a) at 2 $\mu$M and D-puromycin (1b) at 500 $\mu$M. (B) Ras only, L-(4-Mc)-Phc-PANS (2a) at 1 $\mu$M, D-(4-Mc)-Phc-PANS (2b) at 1500 $\mu$M, and L-$\beta$-(4-Mc)-Phc-PANS (2c) at 1000 $\mu$M. Data represent the mean ± standard error for at least three independent experiments.
Figure 4.4: (A) Tricine-SDS-PAGE analysis of globin fragments resulting from puromycin and puromycin analog attachment to the C-terminus. Lane 1, no template, no puromycin (blank); lane 2, globin alone, no puromycin; lane 3, L-puromycin (2 μM); lane 4, D-puromycin (500 μM); lane 5, L-(4-Me)-Phe-PANS (2 μM); lane 6, D-(4-Me)-Phe-PANS (1500 μM); lane 7, L-β-(4-Me)-Phe-PANS (1200 μM); lane 8, puromycin aminonucleoside (PANS) (5 mM). PANS is a negative control molecule (no amino acid moiety) to evaluate the production of protein fragments in the presence of high exogenous molecule concentrations. The globin fragment-puromycin complexes are indicated by brackets. (B) Quantification of the globin fragment-puromycin complexes from A.
Figure 4.5: Model for D-puromycin (red) placement in the large 50S ribosome-CCdA-p-L-puromycin (blue) complex (29). U2620 is the closest nucleotide to the D-puromycin side chain which may cause steric clash. A2486 (yellow), the base originally identified as involved in peptidyl transferase catalysis, is also shown for reference.
sizing proteins can produce markedly different results (9, 28, 31, 32). The data here provide one metric of the chiral and regiospecificity of mammalian ribosomes. We are hopeful that this approach, along with other information such as the ability to optimize tRNA affinity for elongation factor Tu (EF-Tu) (33, 34) (EF1A in eukaryotes), will facilitate the incorporation of desirable but recalcitrant unnatural residues into peptides and proteins.

4.4 Experimental Procedures

4.4.1 General Information

$^1$H and $^{13}$C NMR spectra were recorded on a Varian, Inc. UNITY INOVA instrument operating at 500 MHz using D$_2$O or DMSO-<i>d</i>$_6$ as the solvent. $^1$H NMR data are reported as follows: s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; br s, broad singlet; dd, doublet of doublets. High-resolution mass spectra (FAB) were recorded on a JMS-600H double-focusing, high-resolution, magnetic sector mass spectrometer at the Mass Spectrometry Laboratory, Division of Chemistry and Chemical Engineering, California Institute of Technology. Column chromatography was carried out on silica gel (40 – 63 μm, EM Science). Analytical HPLC was performed using a Vydac C18 column (5 mm, 4.5 x 250 mm) with buffer A (5 mM NH$_4$OAc, pH 5.5 with 10% acetonitrile) and buffer B (5 mM NH$_4$OAc, pH 5.5 with 90% acetonitrile); a linear gradient of 100% buffer B in 50 min was used with a flow rate of 1 mL/min. All reagents were of highest available commercial quality and were used without further purification. Puromycin aminonucleoside (3'-amino-3'-deoxy-<i>N</i>,<i>N</i>'-dimethyladenosine) (PANS) was purchased from Sigma Chemical Co. FMOC-(4-methoxy-D-phenylalanine) and FMOC-(D-alanine) were purchased from Bachem. FMOC-(4-methyl-L-phenylalanine), FMOC-(L-alanine), and FMOC-(L-β-homoalanine) were purchased from Fluka. FMOC-(4-methyl-D-phenylalanine) and FMOC-(4-methyl-L-β-phenylalanine) were from Peptech. Puromycin and puromycin analog concentra-
tions were determined with the following extinction coefficients (M$^{-1}$cm$^{-1}$) at 260 nm: L- and D-puromycin (1a and 1b) [$\epsilon = 11,790$] in H$_2$O; L-(4-Me)-Phe-PANS, D-(4-Me)-Phe-PANS, and L-$\beta$-(4-Me)-Phe-PANS (2a – 2c) [$\epsilon = 10,500$] in H$_2$O; and L-Ala-PANS, D-Ala-PANS, and L-$\beta$-Ala-PANS (3a – 3c) [$\epsilon = 11,000$] in phosphate buffered saline (pH 7.3). Rabbit reticulocyte lysate was purchased from Novagen. Rabbit globin mRNA was obtained from Life Technologies Gibco BRL. L-Puromycin (1a) was purchased from Sigma Chemical Co. Ras mRNA was prepared by using two DNA primers complementary to the 5'- and 3'-ends of the coding region for H-Ras (pProEX HTb vector, a kind gift from Dafna Bar-Sagi) (35) to amplify the gene using PCR. mRNA was produced by T7 run-off transcription (36) of the H-Ras DNA in the presence of RNAsecure (Ambion) followed by gel purification via denaturing urea-PAGE and ‘crush and soak’ RNA isolation. L-$^{[35]S}$methionine (1,175 Ci/μmol) was purchased from NEN Life Science Products. Carboxypeptidase Y was obtained from Pierce. GF/A glass microfiber filters were from Whatman. Scintillation counting was carried out using a Beckman LS-6500 liquid scintillation counter.

### 4.4.2 General Procedure for Preparation of Puromycin Analogs

$N$, $N'$-dicyclohexylcarbodiimide (DCC) (0.0539 mmol) was added to a cold (0 °C) solution of PANS (0.0520 mmol), FMOC-protected amino acid (0.0541 mmol), and $N$-hydroxysuccinimide (NHS) (0.0556 mmol) in dried $N,N'$-dimethylformamide (DMF) (0.900 mL). The solution was stirred for 30 min in an ice-water bath and then for 25 h at ambient temperature. $N,N'$-dicyclohexylurea was filtered and washed (EtOAc, 4 mL), and the filtrate was concentrated in vacuo. For 1b, the residue was resuspended in EtOAc, sonicated, and the mixture was filtered and then dried. The material was purified by gradient flash chromatography using CHCl$_3$ → MeOH/CHCl$_3$ (4:96) for 1b or MeOH/CHCl$_3$ (7:93) for 2a – 2c and 3a – 3c. Homogenous product fractions were dried in vacuo to yield the FMOC-protected product. FMOC-deprotection was
carried out in 20% (v/v) piperidine in DMF (5mL) with stirring for 30 min at ambient temperature. The solvent was removed in vacuo and the residue was subjected to gradient flash chromatography using CHCl₃ → MeOH/CHCl₃ (8:92) for 1b, 2a, and 2b and TEA/MeOH/CHCl₃ (2:10:88) for 2c and 3a–3c to afford the titled products. Confirmation of purity was assessed using analytical HPLC.

9-3’-Deoxy-3’-[(4-methoxy-D-phenylalanylamino)-β-D-ribofuranosyl-6-(N,N’-dimethylamino)purine (D-puromycin) (1b) (37) White solid (31.5 mg, 87.3%): ¹H (DMSO-d₆) δ 1.85 (br s, 2H), 2.58-2.63 (m, 1H), 2.93 (dd, J = 4.5, 14 Hz, 1H), 3.42 (dd, J = 4.5, 8.5 Hz, 2H), 3.51-3.56 (m, 2H), 3.72 (s, 6H), 3.93-3.96 (m, 1H), 4.47-4.51 (m, 4H), 5.17 (t, J = 5.5 Hz, 1H), 5.97 (d, J = 2.0 Hz, 1H), 6.17 (d, J = 5.0, 1H), 6.85 (d, J = 9.0 Hz, 2H), 7.15 (d, J = 8.5 Hz, 2H), 8.08 (br s, 1H), 8.24 (s, 1H), 8.45 (s, 1H); ¹³C (DMSO-d₆) δ 25.4, 50.6, 56.0, 56.8, 61.7, 73.8, 84.4, 90.2, 114.3, 131.0, 138.7, 150.4, 152.6, 158.0, 175.5; HRMS (FAB), m/z calculated for C₂₂H₃₀N₇O₅ (M+H)⁺ 472.2311, found 472.2307.

9-3’-Deoxy-3’-[(4-methyl-L-phenylalanylamino)-β-D-ribofuranosyl-6-(N,N’-dimethylamino)purine [L-(4-Mc)-Phc-PANS] (2a) Pale white solid (18.8 mg, 80.8%): ¹H NMR (DMSO-d₆) δ 1.84 (br s, 2H), 2.26 (s, 6H), 2.52-2.57 (m, 1H), 2.94 (dd, J = 4.5, 14 Hz, 1H), 3.44-3.52 (m, 2H), 3.67-3.70 (m, 2H), 3.92-3.95 (m, 1H), 4.44-4.50 (m, 4H), 5.14 (t, J = 5.5 Hz, 1H), 5.98 (d, J = 3.0 Hz, 1H), 6.14 (d, J = 4.0 Hz, 1H), 7.10 (dd, J = 8.0, 18 Hz, 4H), 8.07 (d, J = 5.5 Hz, 1H), 8.24 (s, 1H), 8.45 (s, 1H); ¹³C (DMSO-d₆) δ 21.3, 41.2, 50.7, 56.9, 61.7, 73.9, 84.3, 90.2, 120.3, 129.4, 129.8, 135.7, 136.3, 138.7, 150.4, 152.6, 155.0, 175.5; HRMS (FAB), m/z calculated for C₂₂H₃₀N₇O₅ (M+H)⁺ 456.2362, found 456.2367.

9-3’-Deoxy-3’-[(4-methyl-D-phenylalanylamino)-β-D-ribofuranosyl-6-(N,N’-dimethylamino)purine [D-(4-Mc)-Phc-PANS] (2b) Pale white solid (20.7 mg, 88.8%): ¹H NMR (DMSO-d₆) δ 1.85 (br s, 2H), 2.26 (s, 6H), 2.61 (dd, J = 8.0, 13 Hz, 1H) 2.96 (dd, J = 4.5, 14 Hz, 1H), 3.42-3.45 (m, 1H), 3.51-3.56 (m, 1H), 3.71-3.73 (m, 2H), 3.94-3.96 (m, 1H), 4.40-4.49 (m, 4H), 4.48 (d, J = 12 Hz, 1H), 5.17 (t, J = 5.5
Hz, 1H), 5.97 (d, J = 2.5 Hz, 1H), 6.19 (br s, 1H), 7.11 (dd, J = 8.0, 16 Hz, 4H), 8.10 (br s, 1H), 8.23 (s, 1H), 8.45 (s, 1H); $^{13}$C (DMSO-d6) $\delta$ 21.4, 41.0, 50.6, 56.8, 61.7, 73.8, 84.4, 90.2, 120.3, 129.4, 129.9, 135.8, 136.1, 138.7, 150.4, 152.6, 155.0, 175.5; HRMS (FAB), m/z calculated for C$_{22}$H$_{30}$N$_7$O$_4$ (M+H)$^+$ 456.2362, found 456.2360.

9-3'-Deoxy-3'-(4-methyl-L-β-phenylalanyl)amino]-β-D-ribofuranosyl-6-(N, N'-dimethylamino)purine [L-β-(4-Me)-Phe-PANS] (2c) Pale white solid (17.8 mg, 73.0%): $^1$H NMR (D$_2$O) $\delta$ 2.06 (s, 6H), 2.45-2.49 (m, 1H), 2.67 (d, J = 6.5 Hz, 1H), 3.18 (t, J = 6.0 Hz, 1H), 3.28 (br s, 3H), 3.37-3.39 (m, 1H), 3.49-3.50 (m, 1H), 3.59-3.62 (m, 1H), 3.80 (dd, J = 2.0, 13 Hz, 1H), 4.08-4.10 (m, 1H), 4.35 (dd, J = 6.0, 8.5 Hz, 1H), 4.46 (dd, J = 3.0, 5.5 Hz, 1H), 5.94 (d, J = 2.5 Hz, 1H), 7.03 (s, 4H), 8.03 (s, 1H), 8.15 (s, 1H); $^{13}$C NMR (D$_2$O) $\delta$ 19.1, 26.0, 40.5, 49.8, 50.5, 54.5, 60.8, 73.0, 82.7, 89.7, 111.0, 120.0, 129.4, 129.6, 134.0, 137.2, 138.0, 148.8, 152.3, 173.6; HRMS (FAB), m/z calculated for C$_{23}$H$_{32}$N$_7$O$_4$ (M+H)$^+$ 470.2519, found 470.2508.

9-3'-Deoxy-3'-(L-alanine)amino]-β-D-ribofuranosyl-6-(N, N'-dimethylamino)purine (L-Ala-PANS) (3a) Pale yellow solid (5.7 mg, 30.2%): $^1$H NMR (D$_2$O) $\delta$ 1.41 (d, J = 7.0 Hz, 3H), 3.28 (br s, 6H), 3.63 (dd, J = 3.5, 13 Hz, 1H), 3.82 (dd, J = 2.5, 13 Hz, 1H), 3.97 (q, J = 7.0 Hz, 1H), 4.17-4.18 (m, 1H), 4.55-4.58 (m, 2H), 4.62-4.64 (m, 1H), 5.98 (d, J = 3.0 Hz, 1H), 8.03 (s, 1H), 8.17 (s, 1H); $^{13}$C NMR (D$_2$O) $\delta$ 17.3, 39.0, 49.4, 51.0, 60.7, 73.5, 82.7, 89.6, 119.5, 138.0, 148.8, 152.2, 154.6, 172.4; HRMS (FAB), m/z calculated for C$_{15}$H$_{23}$N$_7$O$_4$ (M+H)$^+$ 366.1892, found 366.1889.

9-3'-Deoxy-3'-(D-alanine)amino]-β-D-ribofuranosyl-6-(N, N'-dimethylamino)purine (D-Ala-PANS) (3b) Pale yellow solid (8.6 mg, 45.4%): $^1$H NMR (D$_2$O) $\delta$ 1.43 (d, J = 7.5 Hz, 3H), 3.28 (br s, 6H), 3.65 (dd, J = 4.0, 13 Hz, 1H), 3.83 (dd, J = 2.5, 13 Hz, 1H), 4.02 (q, J = 7.5 Hz, 1H), 4.14-4.17 (m, 1H), 4.55-4.58 (m, 2H), 4.64-4.66 (m, 1H), 5.98 (d, J = 3.0 Hz, 1H), 8.04 (s, 1H), 8.17 (s, 1H); $^{13}$C NMR (D$_2$O) $\delta$ 17.0, 39.0, 49.3, 50.9, 60.8, 73.3, 82.8, 89.6, 106.0, 119.0, 138.1, 152.3, 154.8, 172.0; HRMS (FAB), m/z calculated for C$_{15}$H$_{23}$N$_7$O$_4$ (M+H)$^+$
366.1892, found 366.1898.

9′-3′-Deoxy-3′-[(L-β-homoalanine)amino]-β-D-ribofuranosyl-6-(N,
N′-dimethylamino)purine (L-β-Ala-PANS) (3c) Pale yellow solid (4.6 mg, 25.6%): 
^1H NMR (D$_2$O) δ 1.16 (d, J = 6.5 Hz, 3H), 1.74 (s, 1H), 2.52 (d, J = 3.5 Hz, 2H), 
3.24 (br s, 6H), 3.52-3.61 (m, 2H), 3.78 (d, J = 13 Hz, 1H), 4.11 (d, J = 5.5 Hz, 1H),

(FAB), m/z calculated for C$_{16}$H$_{26}$N$_7$O$_4$ (M+H)$^+$ 380.2049, found 380.2054.

4.4.3 IC$_{50}$ Determination

Translation reactions containing [35S]Mct were made up in batch on ice and added 
in aliquots to microcentrifuge tubes containing an appropriate amount puromycin or 
puromycin analog dried in vacuo. Typically, a 20 μL translation mixture consisted of 
0.8 μL of 2.5 M KCl, 0.4 μL of 25 mM MgOAc, 1.6 μL of 12.5X Translation Mixture 
without methionine (25 mM dithiothreitol (DTT), 250 mM HEPES (pH 7.6), 100 
mM creatine phosphate, and 312.5 μM of 19 amino acids, except methionine), 3.6 
μL of nuclease-free water, 0.6 μL (6.1 μCi) of [35S]Mct (1175 Ci/mmol), 8 μL of Rec 
Nova nuclease-treated lysate, and 5 μL of 0.05 μg/μL globin mRNA. Inhibitor, lysate 
preparation (include all components except template), and globin mRNA were mixed 
simultaneously and incubated at 30 °C for 60 min. Then 2 μL of each reaction was 
combined with 8 μL of tricine loading buffer (80 mM Tris-Cl (pH 6.8), 200 mM DTT, 
24% (v/v) glycerol, 8% sodium dodecyl sulfate (SDS), and 0.02 % (w/v) Coomassie 
blue G-250), heated to 90 °C for 5 min, and applied entirely to a 4% stacking portion 
of a 16% tricine SDS-polyacrylamide gel containing 20% (v/v) glycerol (38) (30 mA 
for 1.5h). Gels were fixed in 10% acetic acid (v/v) and 50% (v/v) methanol, dried, 
exposed overnight on a PhosphorImager screen, and analyzed using a Storm Phos-
phorImager (Molecular Dynamics). Analysis in Figure 4 was carried out as described 
above except 6 μL of each reaction and 24 μL of tricine loading buffer were loaded
(1.5-fold increase in stacking and resolving portion of gel; 30mA for 7 h).

4.4.4 Carboxypeptidase Assay

Translation reactions were prepared as described for IC50 determination except reactions (50 µL) contained 2 µL of 2.5 M KOAc, 1 µL of 25 mM MgOAc, 4 µL of 12.5X Translation Mixture without methionine (25 mM dithiothreitol (DTT), 250 mM HEPES (pH 7.6), 100 mM creatine phosphate, and 312.5 µM of 19 amino acids, except methionine), 16 µL (163 µCi) of [35S]Met (1175 Ci/mmol), 20 µL of Red Nova nuclease-treated lysate, and 6.96 µL of 230 µg/mL Ras mRNA (35). Inhibitor, lysate components, and Ras mRNA were mixed simultaneously and incubated at 30 °C for 60 min. Then 2 µL of reaction was combined with 150 µL of 0.1 M sodium acetate (pH 5.0) and 17 µL carboxypeptidase Y (CPY) (1 mg/mL in 0.05 M sodium citrate (pH 5.3) Picrrcc), and incubated at 37 °C for 18 h. After incubation, reactions were mixed with 100 µL of 1 N NaOH/2% H2O2 (hydrolyzes charged tRNAs and removes the red color that may quench scintillation counting) and incubated at 37 °C for 10 min to hydrolyze the charged tRNAs. Then 0.9 mL of 25% trichloroacetic acid (TCA)/2% casamino acids was added to the samples, vortexed, and put on ice for 10 min. The samples were filtered on GF/A filters (pre-soaked in 5% TCA), washed 3 times with 3-mL portions of cold 5% TCA, and scintillation counted to determine the amount of [35S]Met-Ras. For the no CPY-treated samples, [35S]Met-Ras (2 µL of reaction) was TCA precipitated without CPY treatment as described above.
