I must first thank my advisor, Dr. Eric Davidson. It was a difficult, long, and windy road, but one worth traveling.

I would like to thank my committee members, Dr. Marianne Bronner-Fraser, Dr. Scott Fraser and Dr. Kai Zinn, for their continued support and much encouragement.

All members of the Davidson Lab past and present have had some input into the development of this work and myself.

I must specially thank Dr. Chiou-Hwa Yuh (Cathy), as she was instrumental in helping me from the very beginning to the very end of this project.

Also, special thanks to Dr. Andrew Ransick, Dr. Jonathan Rast, and Dr. Veronica Hinman for much guidance during this process.

To Titus Brown for introducing me to dark humor, but specially for releasing Family Relations.

To Dr. Hamid Bolouri, members of the Bolouri Lab past and present, and William Longabaugh in particular for providing us with very user-friendly open source software packages designed specifically with our lab users in mind.

To Sagar Laemle for technical help with the BAC homologous recombination.

To Dr. Anthony Firulli, who took me into his laboratory when I first moved to San Antonio, and who gave my confidence back.

To Dr. Pamela Larsen, who let me join her research group and treated me as a full member of the lab during the last stages of the experimental work.

Dr. Yufeng Wang, who helped me with Bioinformatics and redirected me to a new research area.

To Dr. Kristine Vogel, a colleague, mentor and confidant, but above all, a wonderful friend.

To many friends in science and elsewhere who were present through these many years, and continued to believe that graduation was still on the horizon even after the tenth postponing.

Pam and Ray Heman have been endlessly patient, enormously understanding and always supportive. They are my home away from home and it will always be so.

To my parents, who partially by example and partially through their support made my pursuit of this degree possible. Hopefully, it was worth waiting for.

To my husband, Jim Bower, who believes I can do anything I put my mind to, and holds me accountable for my decisions.

To my son, Ian Bower, who is one of the brightest spots in my life.

Abstract

During cleavage stages, *Spblimp1/krox* is expressed in the large micromeres and veg2 descendents. During later blastula stages, it is expressed in the endoderm precursors of the veg1 ring of cells distal to the vegetal pole of the blastula. Later, its expression is restricted to the blastopore region and the posterior of the invaginating archenteron, and finally to the midgut and hindgut of the pluteus larva. The expression of *Spblimp1/krox* is thus dynamic, and involves several distinct spatial territories. A GFP-recombinant BAC was created to distinguish the expression pattern of the early form from that of the late form. The protein coding sequence of GFP was substituted for that of the second exon, 1b. This construct closely mimics *Spblimp1/krox* expression during early stages of sea urchin development. Using anti-sense morpholino (MASO) knockdown perturbations, we analyzed the downstream targets of *Spblimp1/krox*. We confirmed previously-published data stating that *Spblimp1/krox* autoregulates its own expression, and we found that it represses itself. This negative autoregulation is restricted to the mesodermal veg2 territory during the blastula stage, as shown by WMISH analysis of MASO-injected embryos.

Blimp1/Krox inputs expected from the perturbation analysis into other genes have been incorporated in our gene regulatory network.

Spblimp1/krox has two isoforms that are alternatively transcribed, *1a* and *1b*.

Spblimp1/krox1a is expressed starting at gastrulation. Phylogenetic footprinting analysis reveals several conserved sequence patches several hundred bp long, in comparisons between *Strongylocentrotus purpuratus* and *Lytechinus variegatus* of the genomic region

surrounding the *blimp1/krox* locus. When included in an injected expression construct, one of these conserved patches recapitulates the expression of the *1a* isoform during embryogenesis. This regulatory module of the *Spblimp1/krox* gene, which lies immediately upstream of the transcription initiation site for *Spblimp1/krox1a*, directs expression with great accuracy to the midgut and hindgut of the postgastrular embryo. Work on the regulation of the early *1b* isoform will be reported elsewhere.
