

1–10 Myr-old Low Mass Stars and Brown Dwarfs in Nearby Star Forming Regions

Thesis by

Catherine L. Slesnick

In Partial Fulfillment of the Requirements

for the Degree of

Doctor of Philosophy

California Institute of Technology

Pasadena, California

2008

(Defended July 31, 2007)

Dedication

I dedicate this thesis to the 2001–2002 inhabitants of 05 Robinson,
and to Rim, who clearly knew what she was doing.

Acknowledgements

The list of people without whom this thesis would not have been possible is long, and I will try to be brief.

First and foremost, I would like to thank my advisor, Lynne Hillenbrand, who is primarily responsible for my growth as a scientist during the past six years. I could not have asked for a better advisor, and I feel fortunate to have been able to work with someone for whom I have such deep respect both scientifically and personally. Thank you for being my advisor when I needed it, and my collaborator the rest of the time, for knowing when to guide me, and when to allow me to find my own way.

I consider myself an unusually fortunate grad student to have had not one, but two amazing advisors. Most of my work at Caltech has been done in close collaboration with John Carpenter. Unfortunately for John, he had an office right down the hall from mine, so my seemingly endless stream of questions flowed his way first. Yet, he always listened, ever patiently, offered me a gentle shove in the right direction and then told me to find the rest of the way myself. From John I have learned the great value of meticulousness, of being able to explain every detail of my science. Thank you for your kindness, and for always making time to listen to my questions, no matter how busy you were.

My experience at Caltech has changed my life in so many ways. Not only will I earn my PhD at Caltech, but also I met my future husband in the Robinson hallway. Francis O'Donovan, you are the light, love, and inspiration of my life. Everything I do, including writing this thesis, is more worthwhile knowing that I will be spending the rest of my life with you.

I am grateful for entering Caltech with a fabulous group of classmates, Stuartt Corder, Melissa Enoch, Laura Hainline, Margaret Pan, Milan Bogosavljevic, and Elina Brobeck, without whose support, camaraderie, and comic relief I would never have made it through the first year of grad school.

I owe a huge thank you to my parents, Frank and Sue Slesnick, and my brother Tim Slesnick for all their encouragement during my time at Caltech, and throughout my life. The three of you continue to inspire me, both through your everyday actions and through the support you give to me. And Mom, thank you for keeping me to my word and not letting me drop out of grad school before I had stuck it out at least a year and a half.

I am forever indebted to my good friend Karen Girard, without whose encouragement I would have never run 26.2 miles, and without whose cooking Francis and I surely would have died of malnutrition during the two months prior to our defense.

I appreciate the time and effort contributed to bettering my thesis by members of my defense committee, Mike Brown, Lynne Hillenbrand, Anneila Sargent, Judy Cohen, and John Carpenter, every one of whom graciously bent their schedules to allow my defense to proceed in a timely manner. Robinson is fortunate to have a fantastic group of system administrators, Patrick Shopbell, Anu Mahabal and Cheryl Southard, who keep the building running smoothly, and who have been invaluable to me throughout my six years of computer use at Caltech.

This work could not have been possible without the help and support from the Palomar Observatory staff. I have spent a total of 47 nights observing at Palomar during my six years at Caltech, every one of them made more enjoyable by the delicious cooking and overall friendliness of Dipali and Rose. I am particularly thankful to Dipali, who spent many of her free afternoons taking me hiking in the hills and swimming in the ponds near the observatory. Jean Mueller and Karl Dunscombe have been fantastic company and support to me during my many long nights at the telescope, and were very kind to not complain at my attempting to lay the telescope on its side while observing the southern USco OB association, time and time again. I would like to thank Rick Burruss and Jeff Hickey for keeping the instruments

running smoothly. The Quest-2 surveys were made possible by the Quest-2 collaboration, including David Rabinowitz, Ashish Mahabal, Anne Bauer, Jonathan Jerke, Eilat Glikman, and George Djorgovski.

I was fortunate to be a part of a wonderful group of researchers, including Stan Metchev, Adam Kraus, Russel White, Greg Herczeg, Josh Eisner, and Scott Dahm, with whom I've had many insightful conversations over the years. I am grateful to Phil Massey who, to a large extent, is responsible for my ending up where I am today writing this thesis, and who has stuck with our friendship through the ups and the downs over the past eight years. I owe thanks to Steve Strom for taking an interest in my work, and to my early astro mentors, including Patrick Huggins, Steven Majewski, Bob Donahue and Sallie Baliunas. I would like to thank Wal Sargent, for always saying hello when he saw me in the hallway, Nick Scoville, for coming to visit me in the hospital after I had surgery, and Re'em Sari, for holding my hand while I was learning to scuba dive and I was scared.

I am blessed to be surrounded by so many good friends, who keep me smiling through even the hardest of times. To Melissa Enoch, whom I've sat next to for six years, and Laura Hainline, who is the only person I know that is capable of being as outraged as I can be, thank you for always being there for me. Brian and Danielle Cameron have set me on the road to becoming a wine snob and provided me with countless hours of good times and good friendship. I will forever appreciate Stuartt Corder and Jennifer Edwards for inspiring me to become a reverend and allowing me to officiate at their wedding. I thank my office-mate Milan Bogosavljevic, for introducing me to dunja and sharing with me his home country of Serbia. I am grateful to countless unmentioned people, both inside and outside of Caltech, whose friendship and laughter have made my experience during the past six years more enjoyable. The Caltech Astronomy department is home to a great group of grad students, postdocs, faculty and staff, whose doors are always open.

Abstract

My thesis research has focused primarily on identifying and characterizing pre-main sequence stars in nearby star-forming regions. To this end, I carried out wide-field ($\sim 150\text{--}250\text{ deg}^2$) optical photometric and spectroscopic surveys in and near the star forming regions of Taurus and Upper Scorpius.

In Taurus, the aim of my optical photometric/spectroscopic survey was specifically to probe for a population of intermediate-age pre-main sequence stars outside of the young subclusters that are known to contain most of the young Taurus population. From this work I found tens of young ($\sim 1\text{--}3\text{ Myr}$) and intermediate-age ($\sim 5\text{--}10\text{ Myr}$) stars both near the known Taurus population and to the east, but relatively few pre-main sequence stars of any age to the west. I argued that the new pre-main sequence stars identified far from Taurus can not have originated from the vicinity of the 1–2 Myr-old subclusters and I proposed instead that they comprise a new, previously undiscovered region of recent star formation.

In USco, the aim of my optical photometric/spectroscopic survey was to probe beyond previously explored regions to identify large numbers of 5 Myr-old low mass stars. From the spectroscopic data I have discovered 145 low mass members of USco. Using Monte Carlo simulations I showed that, taking into account known observational errors, the observed age dispersion for the low mass population in USco is consistent with all stars forming in a single burst $\sim 5\text{ Myr}$ ago. I also derived the first spectroscopic mass function for USco that extends into the substellar regime and compared results to similar mass functions derived for stars in four other young clusters and associations.
