My graduate student career at Caltech has followed a somewhat unorthodox path giving me the opportunity to work with several professors in the department, interact with students throughout the division and spend several months in the middle of the Pacific Ocean. The friendly, supportive atmosphere within the Seismo Lab and GPS Division has made this a wonderful place to learn, to teach and to conduct research that is always challenging, always exciting. I would like to thank my thesis committee for the valuable feedback, the professors and students in the Seismo Lab for enlightening discussions and the Seismo Lab, Library and GPS division staff for all their support.

In particular, I would like to thank my thesis advisor Michael Gurnis whose contagious enthusiasm for understanding the dynamics of the interior of the Earth has been invaluable in keeping me motivated through months (maybe years??) of coding and debugging Citcom. The ends definitely do justify the means, now that I've caught the bug.

I would like to thank Joann Stock for taking me along on an amazing geophysical cruise in the Ross Sea off the coast Antarctica, teaching me about collecting and interpreting marine geophysical data and then giving me two more opportunities to do it myself. There's no substitute for the experience of watching bathymetry, gravity and magnetic data come in as the ship crosses from old seafloor to an active spreading center to a trench 9 km deep.

I would like to thank Mark Simons, who as a newly arrived post-doc from MIT, became the pseudo-advisor of one of my orals project and taught me about the geoid, localization, and to ask simple questions about complicated concepts. Mark also taught me \LaTeX , emacs and script writing (GMT scripts, not for Hollywood) all tools of the trade and survival in research.

There is a long list of individuals who have made my experience at Caltech academically and personally rewarding, although it is a long list, I want to include some

of it here because one day I will be old and not remember things so well and these are people I don't want to forget: the reading group crowd – Emily Brodsky, Edwin Schauble, Sarah Stewart-M., Sujoy M., Jeanne Hardebeck, Matt Pritchard, Teresa Lynn, John Moore, Miriam and Simon, Liz Johnson, Derrick Bass, my officemates – Julie Nazareth and Patricia Persaud, my ship-mate – Jane Dmochovski, Shawn Ewald – fellow debugger, Kimo Yap – for keeping the computer going and going and going, and friends – Greg Okin, Ronit Kessel, Rowena Lohman, Anupama Venkataraman, Brian Savage, Antonin Bouchez, Anthony Toigo, Leslie Perg, Mike Oskin, Becky Oskin, Deanna Zubris.

My family has played a key role in this whole process, venturing to ask what I was 'doing' here and enthusiastically listening to the descriptions of why rocks flow like honey when they're hot and deep in the earth, the trials of debugging uncommented code written by someone else and stories of geology and tectonics from Katmai, Alaska to Cape Town, South Africa to McMurdo, Antarctica. In particular, thanks Granie for hours of stimulating political discussions on the phone, patient listening, sound advice and the phone/coffee fund; thanks Marc for answering all of my computer/car/technical question, taking care of the above as needed and checking in on me to make sure I had not been gobbled up by my computer; and thanks mom, for always encouraging me, reminding me of my goals when I had forgotten them and for taking care of Lyra when I went trotting around the globe; and thanks to Lyra (June 5, 1995 – October 15, 2001), my furry friend throughout my years at Caltech, I will miss you.
