SYNTHESIS AND CHARACTERIZATION

The following is a representative, but not completely comprehensive, list of the corrole and azaporphyrin syntheses I developed while at Caltech. It should give the reader a good idea of how these compounds are made without a lot of tedious reference to online Supporting Information files. Some NMR and/or UV-vis characterization data is included for each compound as well. X-ray structures for compounds 1-Ir(tma)$_2$, 1b-Ir(tma)$_2$, 1-Ir(py)$_2$, 1-Ir(dmap)$_2$, and 1-Ir(NH$_3$)$_2$ are included in Appendix C.

5,10,15-(tris)Pentafluorophenylcorrolatoiridium(III) (bis)trimethylamine, 1-Ir(tma)$_2$: H$_3$tpfc (80 mg), [Ir(cod)Cl]$_2$ (335 mg), and K$_2$CO$_3$ (140 mg) were dissolved/suspended in 150 mL of degassed THF, and the mixture was heated at reflux under argon for 90 min (until corrole fluorescence was negligible to the eye upon long-wavelength irradiation with a hand-held lamp). Tma N-oxide (110 mg) was added, and the solution was allowed to slowly cool to room temperature while open to the laboratory atmosphere. Column chromatography of the black mixture (silica, 4:1 hexanes/CH$_2$Cl$_2$) provided an auburn solution, from which purple crystals of 1-Ir(tma)$_2$ (30 mg, 27% yield) could be grown by slow evaporation. $^1$H NMR (CDCl$_3$): $\delta$ 8.99 (d, 2H, $J = 5.4$), 8.67 (d, 2H, $J = 6.0$), 8.55 (d, 2H, $J = 6.0$), 8.23 (d, 2H, $J = 4.8$), $-2.95$ (s, 18H). $^{19}$F NMR (CDCl$_3$): $\delta$ $-138.38$ (m, 6F), $-154.89$ (m, 3F), $-163.27$ (m, 6F). MS (ESI): 1105.1 ([M$^+$]), 1046.0 ([M$^+$-tma]), 986.5 ([M$^+$-2tma]). UV-vis (toluene, nm, $\varepsilon \times 10^{-3}$ M$^{-1}$ cm$^{-1}$):
