In front of you is a huge book, a thesis full of research results. (Well, if you are anything like me, it's an electronic file instead of a book...) This book is a culmination of my graduate research: seven years of work packed into one tome. But really, there is far more than seven years of work that has gone into this thesis. And most of it has not come at my hands: the wonderful people in my life for the last 28 years have shaped everything that you will read about here. If you are reading this, you know my style: very precise, detailed, and perhaps long-winded. So bear with me as I spend a few pages thanking everyone that has helped make this thesis possible.

The first two people that I would like to thank are my advisors: Professor Mitchio Okumura and Dr. Stanley Sander. Mitchio and Stan have been incredible advisors: they have taught me how to do precise, high-impact science. They have taught me how to continually question my own work, always striving for the best possible results. They have kept me guided toward our research goals, yet at the same time let me wander in interesting research directions (most shown by their "tolerance" of all of my theoretical and computational interests!). But perhaps most importantly, both Mitchio and Stan are wonderful people, and have made sure that I remained a "happy graduate student" during my career here. This thesis would not have been possible without Mitchio's and Stan's expert guidance, and I thank them for shaping my future as a scientist.

One of Mitchio's skills has been to maintain a research group full of people that are hard working, intelligent, and fun to be around. It has been a joy to come into work each day and see the members of the Okumura group. Thank you to the graduate students, postdocs, and staff scientists that I have had the good fortune to work with: Andrew Mollner, David Robichaud. Aaron Noell, Laurence Yeung, Kana Takematsu, Kathleen Spencer, David Long, Nathan Eddingsaas, Aileen Hui, Sigrid Barklund, Thinh Bui, Nathan Honsowetz, Heather Widgren, Kathryn Pérez, Leah Dodson, Milinda Rupasinghe, Ralph Page, Marissa Weichman, Laura Mertens, and Linhan Shen.

I would like to single out a few of my co-workers. Andrew Mollner was my mentor for the first two years at Caltech and taught me everything that I needed to know to run a cavity ringdown lab. Andrew is one of the most patient, nicest, and skilled teachers that I have met, and I know that his future students will be in good hands. Laurence Yeung was my officemate in 101D Noyes for over 4 years. He kept me honest on the love of experiments, food, and life, and a large portion of what I have learned in graduate school came from our office chats. Heather Widgren and Marissa Weichman were my two awesome undergraduate students, and I hope that they enjoyed working in the lab as much as I enjoyed hosting them. Ralph Page was a staff scientist in our lab who helped improve my experiments. That is a short sentence, but about 1/3 of this thesis would not exist without Ralph's help. Ralph's strength was helping me cut through all of the "noise" to solve problems quickly, and I can't thank him enough for that. Finally, Laura Mertens is taking over for me as the graduate student in the IR-CRDS / quantum chemistry lab. She has been an enthusiastic learner and hard worker, and I know she will keep the lab in great care. Thanks for putting up with me!

In science, nothing gets done unless you have people to work with, talk to, and bounce ideas off of. Another of Mitchio's and Stan's strengths is how many great collaborators they attract. I was lucky enough to work with Professor Anne McCoy (Ohio State) on a quantum chemistry project. Thanks, Anne, for lending me your resources, discussing science with me, helping me improve my writing skills, letting me learn from you, and most importantly, being a great person to work with. I would also like to thank the members of my candidacy and thesis committees for all of their advice and support: Professors Geoffrey Blake, Paul Wennberg, Vincent McKoy, and Jacqueline Barton.

It takes a lot to keep a laboratory running, especially when a certain somebody (me) keeps breaking things. Rick Gerhart has bailed me out of a lot of trouble with glassware, Tom Dunn has helped me fix burnt-out electronics, and both Mike Roy and Dave Natzic have bailed me out of trouble with machined parts. (Yes, I'm good at breaking things!) Thanks for all of your help and your talks about football, Hawaii, and classic cars. Similarly, it takes a lot to keep a graduate student running: lots of support staff to keep paperwork in line, packages and mail flowing, and smiles to go around. Thank you to Joe Drew, Anne Penney, Dian Buchness, Laura Howe, and Agnes Tong for all of your help along the way. It has been great to work with such friendly people. And Joe, as long as they're not playing my Bills, go Cleveland Browns!

My good fortune extends past Caltech: I have had many great research mentors, professors, and teachers that have helped shape me into a chemist. My undergraduate education at Ithaca College was top-notch, and I thank Professors Vincent DeTuri and Anna Larsen for the research opportunities that they extended to me. My time at Ithaca also helped develop my passion for teaching, and this is thanks to Vince, Anna, and Professor Michael "Bodhi" Rogers, who all gave me an opportunity to teach as many students as I could handle. I also was lucky enough to work at Sandia National Laboratories for three summers, and I would like to thank LeRoy Whinnery and Blake Simmons for making my time at Sandia memorable. It is really amazing how the two of you could teach me so much about independent research in three summers.

I'm pretty sure that you can't finish a thesis unless you are healthy and happy. And I have a lot of people to thank for this. First, a big thank you to Bill Bing, director of the Caltech Bands. Bill is the perfect person to work at Caltech: he pushes students to a high performance level, he is a skilled trumpet player and teacher, and he knows how to keep everything fun. Bill, never retire! I have also been able to play in a couple of outside jazz bands thanks to meeting people through the Caltech music program, and I would like to thank Pat Olguin, Brenda Goforth Adelante, and Eric Kulczycki for giving me the opportunity to play in their bands. I am also an avid football fan – go Buffalo Bills! I thank the Los Angeles Bills Backers, and club president Joy Ammann, for giving me the opportunity to spend my Sundays enjoying football with you. By the way, how do I stay healthy? Great medical care from doctors and nurses. Thank you to Alice Sogomonian, Divina Bautista, Linda Schutz, Dr. Helena Kopecky, Dr. Susanna Friedlander, Dr. Maria Oh, and Dr. Mariel Tourani for all of your help. This thesis would not be possible without all of you.

I have made some great friends at Caltech and Ithaca, and there aren't enough words for me to express how much I value their support and friendship. Thank you Dan Pragel, the one crossover that I have between Rochester and Caltech, and who shares more of my values than either one of us would care to admit. Thank you to my Ithaca College friends, Eric Leibensperger, Beth Gardiner, Eric Callahan, Tasha Kates, and Matt Libera (and many others that won't fit in the allotted space), for 4 years of fun at Ithaca, 7 years of visits and online chats, and many more years of fun to come. Thank you to Kathryn Pérez and Kathleen Spencer, two of my Caltech friends to whom I will be eternally indebted for helping me through my most difficult graduate school trials. To all of my friends: thank you, I am happy every day because of you.

They say that you save the best for last. In this case, I saved my largest thanks for my parents, Nancy Sprague and Jeffery Sprague, and my stepparents, Greg Lewis and Esta Sullivan. 28 years ago, you decided to spend a lot of money to adopt a small child from India. In the years since then, you have taught him everything that he knows: how to learn, how to work hard, how to enjoy life, how to succeed in endeavors, how to endure the trials in life, how to appreciate friends, and how to love family. Most of all, the four of you have given him your love unconditionally. I cannot thank you enough for always pushing me to follow my dreams wherever they may take me, but always keeping a place for me to call home, where I will always know that I am loved. This thesis may satisfy the requirements for a Ph.D. at Caltech, but it was written for the four of you.

Abstract

This thesis describes laboratory experiments and electronic structure calculations on three chemical systems relevant to tropospheric ozone chemistry: peroxynitrous acid (HOONO), hydroxymethylperoxy radical formed from $HO_2 + HCHO$ (R1), and products of alkoxy isomerization (R2). R1 and R2 were studied experimentally using a gas flow cell that combined UV photolysis with cavity ringdown spectroscopy (CRDS). All chemical systems were studied using electronic structure calculations and kinetics modeling.

HOONO is one of the products of the reaction $OH + NO_2$, and acts as a temporary reservoir for HO_x and NO_x in the atmosphere. Torsional excitation of HOONO will break its internal hydrogen bond, leading to sequence band formation in the OH stretch spectrum. Chapter 3 describes a calculated 3-dimensional potential energy surface to examine torsional mode coupling and sequence band formation. We apply these results to previous CRDS kinetics studies of HOONO.

The reaction of HO_2 with carbonyls is believed to be a major sink of HO_x and carbonyl compounds at reduced temperatures. R1 is the simplest of these reactions. Despite numerous previous studies, considerable uncertainty exists on the activation energy and rate constant of R1. Chapters 4–6 describe CRDS and electronic structure studies on the isomerization product, hydroxymethylperoxy. CRDS was used to make the first measurements of the OH stretch and A-X electronic spectra, and the kinetics of hydroxymethylperoxy chemistry. Electronic structure calculations were used to simulate the spectroscopic bands and examine the conformers of hydroxymethylperoxy and 2-hydroxyisopropylperoxy. Atmospheric alkoxy radicals can isomerize or react with O_2 , and each pathway has a different impact on ozone chemistry. Chapters 7–10 describe cavity ringdown spectroscopy, kinetics, and electronic structure calculations on the *n*-butoxy and 2-pentoxy isomerization products, specifically δ -HOC₄H₈•, δ -HOC₄H₈OO•, δ -HO-1-C₅H₁₀•, and δ -HO-1-C₅H₁₀OO•. CRDS was used to make the first measurements of the A-X electronic spectrum of δ -HOC₄H₈OO• and clean OH stretch spectra of all four radicals. Relative kinetics data previously obtained using CRDS were reanalyzed to include the effects of additional alkoxy reactions. Electronic structure calculations were performed to explain the observations that the OH stretch absorption cross section differs between HOR• and HOROO•.

Table 5.6. Summary of acceptable and unacceptable levels of theory14	42
Table 5.7. Calculated A-X, OOCO torsion, and OH stretch of HMP conformer B. 14	43
Table 5.8. Calculated A-X, OOCO torsion, and OH stretch of 2-HIPP14	47

Chapter 6

Table 6.1. Experimental conditions for HMP kinetics experiments	159
Table 6.2. Orders of magnitude for kinetics terms	62
Table 6.3. Determination of k_1 from CRDS v_1 absorption data	68
Table 6.4. Comparison of rate constant $k_{\text{HO2+HCHO}}$ to literature values	171
Table 6.5. Equilibrium constants for HO_2 + acetone from theory and experiment 1	176
Table 6.6. Rate constants for HO_2 + acetone from theory and experiment 1	176

Chapter 7

Table 7.1. Comparison of previous k_{isom}/k_{O2} for <i>n</i> -butoxy and 2-pentoxy	186
Table 7.2. Experimental conditions for <i>n</i> -butoxy experiments	192
Table 7.3. Experimental conditions for 2-pentoxy experiments.	. 193
Table 7.4. Compare our results to previous k_{isom}/k_{O2} for <i>n</i> -butoxy and 2-pentoxy	217
Table 7.5. Calculated integrated intensities for alkyl nitrites	. 221

Chapter 8

Chapter 9

Table 9.1. Kinetics model for <i>n</i> -butoxy	288
Table 9.2. Kinetics model parameters	292
Table 9.3. Chemical species calculated for this study	294
Table 9.4 Harmonic frequencies and intensities, straight chain, B3LYP	302
Table 9.5. Harmonic frequencies and intensities, straight chain, B3LYP vs CCSD	305
Table 9.6. Harmonic frequencies and intensities, 6-31+G(d,p) vs aug-cc-pVTZ	. 305
Table 9.7. Energies and frequencies of HOC ₄ H ₈ • and HOC ₄ H ₈ OO• conformers	307
Table 9.8. Harmonic frequencies and intensities, functional group positions	309
Table 9.9. Harmonic frequencies and intensities for n-butoxy model species	. 314
Table 9.10. First reduced kinetics model for <i>n</i> -butoxy	322
Table 9.11. Second reduced kinetics model for <i>n</i> -butoxy	. 322

Chapter 10

Table 10.1. Experimental conditions for alkoxy experiments	
Table 10.2. Experimental conditions for FTIR spectra of butyl nitrite samples 33	38
Table 10.3. Absolute and relative absorbances for A-X peaks. 34	42
Table 10.4. Observed and modeled HOC ₄ H ₈ OO• lifetime	44
Table 10.5. Parameters used for calculation of correction factors, k_{isom}/k_{O2}	48
Table 10.6. Comparison of k_{isom}/k_{O2} to literature	49
Table 10.7. Scale factors and [NO] in <i>n</i> -butyl nitrite samples	58

Appendix A

Table A.1. Laser performance with Quantel YG-661 Nd:YAG laser	366
Table A.2. Laser performance with Continuum Surelite III Nd: YAG laser	. 367

Appendix B

Appendix C

Table C.1. Comparison of CIS/6-31+G(d,p) to experiment, A-X of peroxy	.406
Table C.2. Comparison of TD-HF, TD-DFT to experiment, A-X of peroxy	. 409
Table C.3. Comparison of Guess=(Alter, Always) to experiment, A-X of peroxy	. 415
Table C.4. Comparison of scaled frequencies to experiment, A-X of peroxy	416
