

Acknowledgements

I could not have set out on this adventure without the support of my family. I would like to thank my husband, Henry, who was willing to relocate in California so that I could pursue my dream of becoming a physician-scientist. In the process, we have supported one another's career goals and have had two beautiful children who we are extremely proud of. I am grateful to have such a supportive and wonderful husband. I would also like to thank my husband's parents, who have been so generous with their time. They have traveled from Korea on multiple occasions for extended periods to help care for my children so that I could continue my rigorous training in the lab. I would next like to thank my mother and father, who have been incredible parents throughout my life and during my graduate experience. I am grateful for their sacrifices and the time they have taken to fly out and watch my children so that I could attend conferences, work at the hospital, and complete my training. I would like to thank my brother, Terry, and his wife, Melissa, who have been a part of my local support system. It has been so great to have family in town that has been so supportive of my journey. I would also like to thank my sisters in Seattle, Janice and Jessica, and brother in Chicago, Billy, who have given their encourage and support throughout the years. Lastly, I would like to thank my son, Harrison, and daughter, Sabrina, who are the best children in the world. They have also supported my graduate experience, coming to lab with me so their mom could finish up experiments. They have offered a balance and aspect to my life that is truly indescribable.

I cannot thank enough my advisor David Baltimore for making my graduate experience an absolutely wonderful and transformative experience. You have taught me to cultivate and follow the questions that drive my science and passion. With your support, I have

had the time to think freely and pursue new ideas and projects of great interest. In particular, our manuscript regarding lentiviral vectors has been an exercise in following where the data takes you, disregarding preconceived notions, and thus discovering new ideas. I came to this lab to receive rigorous training, which has allowed me to think creatively, have the courage to challenge the norm, and devise clever ways to solve problems. In addition, I want to thank you and Alice for all your warmth and support as I began motherhood my graduate experience. The baby blanket you gave my son continues to be his favorite. Thank you for always understanding and respecting my priorities outside of work. As I set out on my path to become an independent scientist, I feel deeply honored to have known such a brilliant scientist and kind person, and to have received my training by you and the lab.

My thesis committee has been critical to my development as a scientist. I have to thank Otto Yang for his unwavering support over the years. Thank you for all your advice, mentorship, and driving over to Caltech for all our meetings! I would next like to thank Sarkis Mazmanian, who has provided important insight into this project and challenged me to be a better scientist. I would next like to thank Pamela Bjorkman, who has provided her vast knowledge during my graduate experience. Lastly, I would like to thank Paul Patterson, a brilliant scientist and wonderful mentor, who had always encouraged me to come to Caltech to pursue my PhD training.

I also would like to thank all the members of the Baltimore Lab who have helped with my graduate training. I have known so many great scientists and people who have made this journey possible and unforgettable. There have been so many students, post docs, technicians, scientists, and staff who have touched my life and been so encouraging throughout this process. I would like to thank Lili Yang for first helping me learn basic

molecular biology techniques, and animal work, and for providing helpful insight into experimental design. She has been a wonderful friend and role model of a woman in science. I would also like to thank Alex Sigal for his willingness to take me under his wing and teach me basic tissue culture techniques, microscopy, and ways around the lab. Along the way, you have become a great friend and I have enjoyed our discussions on science, people, and life. I have had a lot of fun in your company and laughed to tears at your Passover dinners, the breakroom, the HIV facility, and just about everywhere else. I would next like to thank Alex Balazs, who has been critical to my graduate experience. You have been a sounding board at the very beginning of this project and were instrumental in developing the idea of a platform of VLPs to identify the viral component required for immune activation. I miss our walks to Ernie's, in which we discussed just about everything including where our future paths were taking us. We have had a lot of fun at your apartment parties and will not forget karaoke night or the Magic Castle. Next, I would like to thank Alex So for his friendship and guidance throughout my time here. He has been the voice of wisdom, encouragement, and sanity when things did not always appear as if they were going to work out. I have deeply appreciated your advice on my scientific writing and clever insight regarding my science. I would next like to thank Michael Bethune, who I have learned a lot of basic techniques related to cloning and protein purification and also enjoyed our discussions on science, family, and the world. Michael is one of those great and rare people in life who you like right away, but seem to impossibly like more and more every year. Your intellect, sense of humor, kindness, and spot-on whistling will be much remembered. In addition, Yong Ouyang, aka Stella, you have been a great friend and colleague throughout my graduate career. We have a lot of discussions regarding scientific protocols and experiments as well as personal talks that have been so deep and meaningful. I would not have been able to make it through without your friendship. Lastly, I would like to thank Joanne

Laurence who has been a supportive and incredible friend in the lab. You have been so kind and caring about my graduate training and personal transition to motherhood. You have been a great friend and I am very grateful for your support.

I would also like to thank Pin Wang at USC and his laboratory for their collaborative efforts. I worked with several of his post-docs and graduate students who have been a tremendous help in my scientific training. Pin has been generous and instrumental in providing knowledge and resources on my PhD thesis.

Last but not least I would like to thank so many people in the UCLA Department of Medicine, Division of Infectious Diseases, and STAR program for their support. I would like to thank Linda Demer and Joy Frank, who are incredible woman scientists and have been so positive throughout my training. In particular, Linda, you have been such an encouraging mentor and helped me navigate my way to becoming a physician-scientist. I would also like to thank my UCLA research advisors Otto Yang and Martha Lewis, who have put considerable time into mentoring me throughout my fellowship. Next, I would like to thank Judy Currier, my chair of Infectious Diseases, and Alan Fogelman, my chair of medicine, who have been incredibly patient, generous, and supportive throughout my training.
